Jay, you cannot put the crystal in the cobra 148 they work of of a
phaselockloop system they don't use crystals like the older radios did
Changing the crystal that is in there would no doubt render the radio
inoperable at least on 27 mhz

5. Re: Texas star mod?

Newsgroup: rec.radio.cb
Date: 1999-12-01 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <U9j14.861$y3.21083@insync>
Source record: 13454

The best mod to do to it is to put larger power wire on the input, as well as kill the stupid fuse block.

The next best thing to do is change the value of the resistor that supplies bias to one that will allow you to run a bit higher voltage. With slightly higher resistance, you can run 15 volts on that amp just fine, and it will give you mo power output.

Don't ask me what value of resistance because I have found each amp to be slightly different, as the value of beta of the transistors is different in every case.

However, you NEVER should have to go to 100 percent higher... In between the original value and about 75 percent is the biggest change I have had to make.

Also, the electrolytic on the 12 volt buss should be increased (voltage)... They have some marginally rated caps that need to be bigger when running more volts / watts.

Their are others, but if you don't know how to do them, I don't suggest trying to follow someone else's instructions. These that I gave you will help.

Took pride in their work...

Dick is no longer the controller of the company, and the current crop of amps they put out show that.

However, I agree.... It is a nicely made amp, and can be retrofitted with tubes that are more commonly available when you blow all three bottles!

Fujitsu used to make them.

Fujitsu rights where licensed to RCI (or one of Peng's contractors) and they have the line now.

However, the RCI branded chips don't seem to work as well as the older Fujitsu models.

They also made an MB8734, which was nearly unmodifiable (Pin 10 wasn't internally connected.)

No,

A real amp is cooled with water, and the only reason to have the blower is
to cool the equalizer resistors on the power supply.

No,

A real amp is cooled with water, and the only reason to have the blower is
to cool the equalizer resistors on the power supply.

Hey,

Just to FYI the group...

I did more testing on the RX problem I was having (with 153 making a perfect copyable signal on 26.085 or whatever..)

I have been unable to duplicate the problem with anyone else, leading me to believe that their was a problem with his transmitter. Hvae had it in the mobile for the last week, and has great ears, good transmit, and I really do like it!

Also, it picks up less hash type noise... The 148F would pick up the switching oscillator in my stereo amp at S5, but the James doesn't barely hear it.... And, the James picks up people I couldn't hear before.

Toll Free

Hello group,
Long time lurker here and I feel the need to respond to this post.I being the proud owner of the cross breed mirage rci 2950 have found this radio to be one of the best radios for the money out there.
I have also experianced most of the small problems you guys post about this radio such as the vairiables in tempeture,over mod ,because of q32 do not ever remove this.the radio itself has more mod than you need without that kind of buthery.the main problem that I have found is the stock power wire that comes with the radio. change this out with thicker wire and youll see a lot of your problems dissapear.
thank you,
843 HOMEGROWN RADIO N,J

Source record: 13493

Greetings!

Yeah, I know. It's not hard to understand the concept, it's hard to describe it.

To break it down, Conjugate match is much like what you've added.

Using coax, with it's own responses to the antennas non-resonate impedance, can offer a means to oppose the non-resonate antenna to make the system appear resonate.

The hardest part to convince them of this is.

When the antenna is made resonate, before leaving the factory, using a specific length of coax. The antenna *needs* the specific length in order to show any sort of tunable SWR.

It is up to the operator then, to mount the antenna in a way that makes the antenna resonate without having to use a specific length of coax.

It can be done in a variety of ways.

Antenna makers have gone a long way in realizing this. So, they make antennas work in most installations. It's the extremes that get people all riled up.

Some Ham operators don't realize that ground image plays an important role in how the antenna can, or can't, decouple itself from the feedline.

It's funny to sit back and watch. I don't like trolling, but this stuff [coax length] gets some people all worked up.

Thanks for letting me know about "over".

While Dancing with the Mouse on Wed, 01 Dec 1999 01:16:11 GMT, the Modem interrupted with an MNI from "MC 10kW Jesus <qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

GToyama wrote:
>
> I have a mag-mount with stainless whip. 2 questions:
> 1) does SWR change if antenna is transferred between vehicles?

SWR is affected by the location of the antenna on the vehicle in
relation to other metal, roof top, etc. SWR can change if you are parked
and open a door, or someone is standing nearby. An antenna which appears
flat on one vehicle might be quite high on another. Adjust the antenna
to the vehicle you will most commonly use it on and if you must change
it over, find a location on the second vehicle which shows the lowest
swr without making adjustments. Much easier to just buy a second antenna
and plumb it into the car properly rather than always have a temporary
setup.
>
> 2) for a given vehicle/antenna combo, does SWR change if a different radio is
> used?

If the radio shows 50 +/- ohms impedance as it should, any radio should
interface. You don't need a radio connected to check and adjust SWR.

> www.jcre.com/titan.htm

I believe that the Titan is not the same as the HTX-10 or the
4900, the size and the layout of the face is close but the internals are
different. The Titan 485 has the plus / minus 5 kHz button same as the
Sidewinder 400. The HTX and the 4900 can be tuned in smaller increments. Now
the Titan handheld is better and like the Spitfire can be tuned in smaller
increments. As for swapping out the CPU to gain features, that
might be possible but most likely not worth the effort. This "new" series of
radios, the Cherokee, Eagle, Titan, Albrecht, 4900 and others are all made
in Korea with a Sanyo CPU. Not high quality but good bang for the buck.
Given time they should improve, (and are!) and five or ten years down the
road they may be looked at with fond memories like the 2510 and some of the
"good old" Cobras!

Well if you were involved & bought a new tractor or truck you
would get a owners manual from Jacobs Engine Co. In the manual it
tells you to use it in both moderate & heavy traffic! In fact it tell
you to turn it on when you leave your yard & leave it on at ALL times
to allow it to releave the stress on the brake system. Even many fire
dept. have them & at 3:00 am they use them around my house when
slowing for a curve. I just want to clear up the misconception that
they were only designed to be used on rual mountians. The manufacture
of them puts the information in their manuals to use them at the
places that you are complaining about...

>brake in built up areas - especially when decelerating behind a stopped car at a
>light.

While it's not considered "courteous" to run your jake in the city, a
good case can be made arguing it's benefits. I have to draw the line
though at running through the truck stop parking lot at 2:00 AM with
the jake on. With the introduction of the "Super 10" transmission,
many drivers developed the habit of using the jake in it's lowest
setting to help in shifting through the button shift gears. In my
opinion, this is only a benefit when upshifting on a climbing grade.

>They are also known for releasing the air from the brake systems when
>trying to "hurry" people along at crosswalks.

This is just an assumption on your part. The driver has no control
over when the _automatic_ air drier blows out moisture from the air
system. That is most likely what you hearing. The only other way to
release air from the system is by popping the brake valves. Doing
this sets the spring brakes on either the trailer, the tractor or
both. This releases all of the air from the brake systems. In order
to move again, the system needs to be recharged with air because the
lack of air pressure causes very powerful springs in the brake drums
to engage the brake shoes against the drums. It's a safety system.
While it takes only a couple moments to recharge, it's a hassle
because you can't move until the springs release. A driver in a hurry
would never do this. Releasing pressure on the brake pedal will cause
an small amount of air to escape the brakes. Hard to say that this is
intentional. Your foot moves on the brake. It takes less pressure on
the pedal to hold the truck at a stop than it does to actually stop
it. Just like your car.

>I think truckers are quite
>courteous most of the time on the road, but when the weather is crappy a lot of
>'em take bad risks and put 4 wheelers into dangerous positions. Where I live,
>there have been a rash of tipped trailers and flying truck wheels lately.

You ought to see the dangerous positions that four wheelers put trucks
in every day from the driver's seat of a big truck. I guarantee you
it would change your attitude about trucks forever. People drive
around them like they are just cars that can stop on a dime.
Sometimes trucks are rolled over due to inexperienced drivers in bad
situations. Often times, it's the result of the truck turning hard to

avoid killing a family who just did something awfully stupid in front of them.

Accidents happen. This entire country lives and dies by the truck. Without them, you have nothing. There's a lot of them out on the roads, each logging approximately 130,000 miles a year. Some more, some less. The average car drives 12,000 to 20,000 miles a year, yet is involved in many more accidents than the average truck is. It's because of professional drivers that this accident rate isn't incredibly higher. Give 'em a brake. They are out there laying their life on the line everyday so that you can have everything that you have. All for about $30,000 a year, before expenses.

If you touched it, a trucker brought it...

74. Re: What is Range of 4W Handheld CB?

Newsgroup: rec.radio.cb
Date: 1999-12-02 00:00:00 UTC
From: Konrad Freeman <Public_Library_Terminal#3@merck.com>
Message-ID: <3846B30F.1CAF9181@merck.com>
Source record: 13523

A typical maximum useful range for 4W handheld CB is between 1 to 5 miles
depending on many factors (weather, transmission frequency, open space vs
crowded buildings, length of antenna etc.).

Frog@mageos.com wrote:

> I recently picked up a 4W GE handheld CB on sale for possible emergency

Miles,
Sadly, if it wasn't so damn true, I might be offended by that statement.
But you're so right on that it's sad (not that you're right but that it's
true, mind ya). I haven't fired up any of my ham gear in the past 3 years
becase of bozos like those racist assholes "B.A.R.F." and the dumbasses that
unlawfuly jam them. Hell, up here we've got some deranged old coot that
holds nets on a local repeater 24-7.. problem is, nobody else is part of his
imaginary net. It's sad. Really really sad.
The art (and at one time it was an art.) of amater radio is dying, and
thanks to the likes of those down on 80m/75m, it won't be long before
Motorola comes along with a impressive amount of $$$, and buys up the bands
from us....11 meter too.

Skip is the only thing letting you talk,your 100 watts and his
3-400(when he gets it)won't do the job on this band,your at the mercy of
the ionosphere.
An 11 meter system to do what you want would cost so much and attract
so much unwanted attention that the idea is foolish.
Reliability can only come with lower freqs....MHZs lower.

92. question about HyGain I 40ch

Newsgroup: rec.radio.cb
Date: 1999-12-02 00:00:00 UTC
From: bill <bwiese>
Message-ID: <01bf3d0d$27fa2f80$6c84c03f@bill_pc>
Source record: 13541

Folks -

Does anyone out here know PLL details about a basic
HyGain I AM rig, model #2701? The rig is 40ch unit,
gonna be a Cybernet chassis.

Since it's 40ch, it's gotta be synthesized (I know it's
a PLL02A chip). Does any RKI know if this is a 3 xtal
(w/mixer offset osc.) or a newer 2-xtal job?

One clue would be if the 2701' PCB# is PTBM03nAOX,
where n=3,6,9 (mabye even 1). These guys have the
3rd xtal for mixer offset. If it's a PTBM04mAOX
where m=6 or 8 then it's gonna be a newer 2-xtal
architecture not suited for my needs. ;-)

Thanks!
-Bill

The first thing I did was bookmark it! Fantastic site! I had the pleasure of doing business with 2 factory authorized Browning dealers in the '70 's, in South Jersey. Karl Stein of Egg Harbor, NJ, and Bill Clarke of merchantville. My everyday radio is a modified Mk.1. The transmitter has a 6L6 inplace of the 6BQ5, and a 2E26 in place of the 5763. The receiver has the 31.1 and 31.7 mhz. xtals along with the 40 channel dial. The cosmetic appearance is a 5+, but she walks 'n talks! This is the way the radio was when I bought it 15 years ago. You ain't got a thing, if you ain't got that PING! 73, Crazy Bob KGM-4216 EC-3071 KF2IB.

I recently bought an antenna that is supposed to create its own ground plane. It's a fiberglass antenna, but has a round plastic piece attached near the bottom, and the cable screws into it. There are no wires going from that piece to the wire wrapped around the antenna. How does this antenna work? It does work pretty well.

Thanks,
John

Turning the squelch up has nothing to do with the range of your transmitted signal. With dual antennas at the corners of the cab, the signal is most potent from side to side, not front to back. Try adjusting the length somewhat for a lower swr if possible or use a single antenna, mounted in a more central location.

I dunno 'bout where you live, but where I am many truckers will use their jake brake in built up areas - especially when decelerating behind a stopped car at a light. They are also known for releasing the air from the brake systems when trying to "hurry" people along at crosswalks. I think truckers are quite courteous most of the time on the road, but when the weather is crappy a lot of 'em take bad risks and put 4 wheelers into dangerous positions. Where I live, there have been a rash of tipped trailers and flying truck wheels lately.

Every 5 pin RS microphone ever made....

Pin
1 shield of mic audio line (ground)
2 grounds out mic audio input when in Rx (blue)
3 PTT line. This is switched to ground (pin1) when key pressed(red)
4 mic audio line. inside shield (wht)
5 receive enable line. this switched to ground when key released (blk)

Not all RS radios make use of all 5 pins - but most do. All the microphones are the same.

Be sure to check out my Realistic Pre-Amp Mic Modifications I posted a week or so ago on this group.

Exactly right! Perhaps he meant that he could not HEAR very far.....

>With dual antennas at the corners of the cab, the
>signal is most potent from side to side, not front to back.

I'm puzzled. I've never used the co-phased antenna arrangement, but I thought the purpose was to "beam" the signal toward the front and rear so you can communicate better up and down the highway. Although the cab is gonna block the forward signal somewhat, I suppose.

>or use a
>single antenna, mounted in a more central location.
>
>

I think that's a very good suggestion, Gary. Unless he runs up and down the Interstate highways, a more omni-directional antenna arrangement will be better.

Here's another thought....if I remember my antenna theory right, the two antennas have to be a certain physical distance apart to form an effective directional array. His poor receive might be due to having them too close together, such as would be the case on a pick-up truck's side rails. I notice that the big trucks mount them out on the mirrors. I suspect there is a reason for that--to get the proper distance.

Now, for iskee (the self-proclaimed "newbie"):
Glad you brought this question to the group. Hope the info you get is helpful.

Here's a simple analogy concerning any kind of directional antenna:

Compare it with a flashlight bulb. Hanging in free space, the light scatters in all directions and quickly disappears. Installed in a reflecting mechanism, the light is "beamed" in one direction and is much stronger. However, in other directions, the light is more dim (or GONE).

The power is the same. It simply was concentrated in one direction. This is how antennas work. A simple ground plane or mobile whip is like the bulb hanging in free space. However, various kinds of antennas have been developed to concentrate the energy to accomplish a specific purpose. For example:

A multi-element array will send the energy in the direction of the antenna's beam. That's great for a base station where the operator wants to send the signal in a specific direction, but it would not be practical if you want to

transmit and receive from all directions.

In that case, you can put up what is known as a 5/8-wave antenna, which will still radiate in all directions at once, but the energy which normally goes up at a high angle is now concentrated toward the horizon--giving improved signals.

A 5/8-wave antenna is quite long, physically, and thus is not practical for a vehicle. Typically, we use a quarter-wave antenna on a car or truck, but it seldom can be put in the center of the vehicle and thus ends up transmitting better in some directions and worse in others. One solution is to use a base-loaded whip (Wilson 1000, or K-40, for example) to allow a shorter whip which can be mounted in a more ideal location (like say, the center of the roof). This gives more consistent radiation in all directions with only a small sacrifice in gain.

SUMMARY: Choose the antenna type by what you wish to accomplish. Co-phased arrays are highly directional and probably are counter-productive in a passenger vehicle being operated around town. But, to a over-the-road trucker interested in keeping up with his fellow drivers or knowing what's happening way ahead of his rig, they are ideal.

Best wishes,
QRM

In this case it is a fair bet. If you make the fundamental of the crystal the same as the operating frequency you can turf out a lot of components. I believe it is more likely that the unit is operating on 11A than 24. As for modifying it for voice, possible but there is no point.

Do the big rigs up north keep their engines running all winter long?
I heard that they did this because if they shut them off, the engine
would get to cold and it would be more of a hassle to get it started
then to just leave it running and pay the fuel bill.

The problem is that during the day, your going to have a high noise
level. This is a property of the band. You are probably monitoring
channel 19?

I don't understand why people must insist on putting thier two cents into a subject if they don't have a answer for the question.

I think the better way to go about things is maybe ask the person that made the post if they have a idea on why the choke burned up.
The answer is this simple, The person that had the amp before me over drove the amp and burned the choke on the input side of the amp....
I hope we took the guess work out of all your posts.
I respect all of the people the try to help but to the people that offered no help and think that they are better then everyone else, The old saying go's like this. If you have nothing nice to say, Don't say anything at all..
Thank you for your time. We back out.

Cross country drivers leave em running allot because they need the heat to sleep in the sleeper berths.
Many drivers have gone back to the good old days type living like a gypsy, in the truck instead of a motel.
Truckstops have for the most part very nice shower facilities so allot of drivers sleep in the truck and shower at the truckstops when they stop for dinner, fuel etc..
With todays technology its easier to start a truck than it was a few years ago with fuel preheaters and such, but the seriously hard winter weather can still wreak havoc on the fuel system of a large car.
I've never heard of leavin em run all winter though.

I got an offer today on an Emporer TS-5010 for $100.00. It is in really great shape and works tried it out today. It's an amature ham radio. But as most of you allready know I know nothing about cb's etc. So is this worth what the person wants for it? Also I heard there is one called and Allan something that is almost identicle? Which one is better. I have tried looking at different sites for this radio but cant find it anywheres. I was wondering also what the price for a new one would cost and if so is there a place on the internet to get one?
Thanks....

Do I really need more from a 2970 than 100 plus watts?
At 4:30 PM EST I spent a little more than 25 minutes talking to little brother on 26.855 am. We both had crystal clear copies on each other except for three times when a monster station stepped between us.
I am pleased but little bro is talkin about puttin 3 or 400 watts behind his 2950 in the big purple Peterbilt with twin Wilson 2000 truckers. Right now he is running the 50 at the way it works after being peaked and clipped but is going to get a few other minor mods done.
This ought to make somebody's skin crawl.....he's gonna put an echo box in the 2950 so it will sound better and I think it'll be after the first of the year but I think I will be putting one in my 2970.
For now we are both very pleased.
The purpose for the original post was because we have noticed during our last 3 contacts that as the sun goes down here in PA I don't put out or receive near as much skip traffic. When the sun is up the skip is occasionally unbearable.

Thanks gang,
Dillo

the ssb power is not going to change with the power control it is taking the power from a different circuit then AM. SSB uses power to get modulation out of the radio you could turn it down inside the radio but I wouldn't mess with it they are set to work the way they are set up.

Yes, removing Q 32 does disable the ability to vary your SSB power output via the RF power output knob on the front of the radio. To get around this, simply adjust your mic gain accordingly. Since SSB is strictly audio driven, reducing your mic gain will also reduce your power output.

As to experiencing radio failure due to the removal of Q 32, i sincerely doubt that. There MUST have been other improper mods done to the radios to cause premature failure. I have yet to have one radio ever come in that suffered problems from someone doing that. Sean
>

He meant that the factory power cord that comes with the radio is insufficient. After modification, the radio is pulling a greater amount of power and the power cord can become the limiting factor.

If your display lights dim drastically when keying and modulating, your voltage is dropping due to the radio starving for power. By replacing the factory 16 gauge power cord with a heavier wire (MAKE SURE IT IS STILL PROPERLY FUSED), you may see greater power output, higher modulation levels and better frequency stability on SSB. Hope this helps. Sean

This typically occurs due to overdrive. Most people think that this amp will survive with a 10+ watt carrier level being fed into it. They are mistaken. I might have one that is in for repair, but not sure. I'll take a look and see what i can come up with. Sean

144. Increasing performance

Newsgroup: rec.radio.cb
Date: 1999-12-02 00:00:00 UTC
From: dongilbert@my-deja.com
Message-ID: <82681dgbr1@nnrp1.deja.com>
Source record: 13593

Hi there. I am new to this group so forgive my ignorance on some of these subjects. I have a c.b. in my daily driver, (89 f-150 truck) it is a Uniden weather max I believe. I drive about 60 miles every day on the highway. Is there a way to boost the transmitt and receive capabilities of this radio by doing something internally to it? I am not wanting to talk 100 miles away to someone else just boost the performance slightly.

And I know all of you are going to laugh at me on this one but the antenna I use is the cellular look alike on the window. I know this is not optimal for performance but do not want to mount a huge antenna to my truck. The other thing is that I plan on intalling a bedcover and this cuts down mounting options extensively.

Right now I only have line of sight capabilities, meaning I can usually talk to truckers if I can see them. Any suggestions on improving this would be greatly appreciated!

Toll's suggestions are all valid, depending on how far you want to get into it. For most applications, just changing the power wires and bypassing the factory fusheholders will show a measurable increase in performance on the Texas product line. I do recommend running an in-line fuse, but this should be mounted as close as possible to the power source (battery).

From my experience, here is a basic guide as to what gauge wire should be used with the various amplifiers. Keep in mind that these are for relatively short lengths of wire (appr. 10' - 12'). They are the MINIMUM allowable to obtain maximum performance from the amplifier. Longer runs should go to the next heavier gauge to minimize voltage drop. Amplifiers with bias (Texas Star) will pull more current than "competition amps" with no bias (Dave Made, Pirate, X-Force, etc). Amplifiers that are being driven harder via built in drivers or an external driver amp will also pull more current. They should use the next heavier gauge wire down the list. Take this into account when selecting the proper wire for your installation.

ALWAYS place some type of fuse / breaker at the power source to protect the vehicle from an electrical fire. Under competition conditions, if your worried about the fuse possibly current limiting the system, use a slightly bigger fuse than necessary. This will still blow should a direct short to ground occur and may save your vehicle from becoming a rolling flame thrower or even your own death-trap.

How much is you or your families safety worth ???? I know people that have completely lost their vehicles due to fires started from poor radio / amplifier installations. I had also specifically warned another local about his poor installation, yet he didn't correct it. He did end up having a car fire because of it. The scary thing is that his kids were strapped in the back seat in child seats and he couldn't get them out of the car very quickly. Luckily, nobody was hurt. Things like this DO occur, so don't be dumb or cheap. (Sorry to rant so much, but this is VERY important.)

2 pill (1446's, 455's, etc) = 10 gauge

2 pill (2290's, 2879's , various Motorola's) = 8 gauge

4 pill (1446's, 455's) = 8 gauge

4 pill (2290's, 2879's, various Motorola's) = 6 gauge (4 would be better)

6 pill (2879's, etc) = 4 gauge

8 pill (2879's, etc) = 2 gauge

10 or 12 pill (2879's, etc) = 0 gauge

16 pill + (2879's, etc) = Double 0

Also keep this in mind when looking to purchase amps. If the wire gauge coming out of them is measurably smaller than what is specified here, the manufacturer is cutting corners and costs. Where else are they saving money at INSIDE the box ??? Hope this helps and be safe out there :) Sean

Toll Free wrote in message ...
The best mod to do to it is to put larger power wire on the input, as well as kill the stupid fuse block.

The next best thing to do is change the value of the resistor that supplies bias to one that will allow you to run a bit higher voltage. With slightly higher resistance, you can run 15 volts on that amp just fine, and it will give you mo power output.

Don't ask me what value of resistance because I have found each amp to be slightly different, as the value of beta of the transistors is different in every case.

However, you NEVER should have to go to 100 percent higher... In between the original value and about 75 percent is the biggest change I have had to make.

Also, the electrolytic on the 12 volt buss should be increased (voltage)... They have some marginally rated caps that need to be bigger when running more volts / watts.

Their are others, but if you don't know how to do them, I don't suggest trying to follow someone else's instructions. These that I gave you will help.

147. Ignition Noise - bruit d'allumage

Newsgroup: rec.radio.cb
Date: 1999-12-02 00:00:00 UTC
From: ddufault_ve2bap <ddufault@dsuper.net>
Message-ID: <826a5i$i4q$1@nnrp1.deja.com>
Source record: 13596

Ignition Noise - bruit d'allumage

Lorsque le moteur de ma voiture tourne (une Dodge Caravan 1999), je constate qu'il g'n're des parasites qui brouillent la r'ception de mon 'metteur-r'cepteur radio-amateur (Icom IC-706). La r'ception de la radio AM-FM est 'galement tr's affect'e. Le probl'me se pr'sente de la fa'on suivante : lorsque le moteur est 'teint (la clef sur ' accessoires '), je syntonise une station 'loign'e dont les signaux sont faibles mais clairement audibles. D's que je d'marre le moteur, je perds la r'ception du signal. Le bruit d'allumage g'n'r' par le moteur est audible avec un fort signal sur tout le spectre couvert par ces deux r'cepteurs. En d'modulation AM, j'entends tr's clairement le bruit du moteur dans le bruit de fond; le bruit d'allumage d'modul' ' sortant ' du haut-parleur varie avec la vitesse (RPM) du moteur, et ce sur les deux r'cepteurs en question. Sur mon r'cepteur amateur, j'ai un indicateur de l'intensit' du signal re'u (s-m'tre), qui monte pratiquement ' la moiti' de son 'chelle lorsque le moteur tourne. Lors de l''coute de cassettes, le probl'me n'est pas pr'sent. En bon technicien que je suis, j'ai tent' d'investiguer la source du probl'me par moi-m'me.

J'ai d'abord suppos' que le bruit atteignait mes r'cepteurs radio (auto et radio-amateur) via l'alimentation 12 V. DC. Pour m'en assurer, j'ai branch' tour ' tour ces deux r'cepteurs sur une seconde batterie ' ind'pendante ' (une gel-cel), donc compl'tement isol'e du reste du circuit. Malgr' cela, le probl'me est toujours pr'sent, et ne diminue pas d'une miette! L'interf'rence ne provient donc pas du circuit d'alimentation, et il serait donc inutile d'ajouter une filtration (genre choke R-L) sur le 12 volts DC.

Lorsque je d'branche l'antenne (autant sur le AM-FM que sur la radio-amateur) alors que le moteur tourne, le bruit dispara't. Si j''loigne l'antenne du v'hicule en la laissant branch'e au r'cepteur, le bruit diminue progressivement. J'ai aussi constat', lors de mes essais, que je brouille aussi les r'cepteurs des v'hicules gar's ' c't' du mien'!

Voici les lectures du niveau de bruit prises ' diff'rentes fr'quences, avec mes antennes habituelles; on constate que le niveau de bruit d'allumage est encore tr's 'lev' ' une fr'quence radio aussi 'lev'e que 446 MHz :

fr'quence antenne radio lecture

31.000 MHz AM fouet ' onde Icom IC-706 8 (sur 60)
144.100 MHz AM fouet ' onde Icom IC-706 7 (sur 60)

446.100 MHz AM fouet onde Icom IC-706 5 (sur 60)

640 KHz AM fouet Chrysler AM-FM Chrysler bruit tr s lev
92.9 MHz FM fouet Chrysler AM-FM Chrysler perte de sensibilit

J en arrive donc la conclusion que l interf rence (le bruit) est irradi , c est dire que le moteur met des ondes radios dont les harmoniques s tendent jusqu 500 MHz (fr quence la plus haute sur laquelle je suis brouill), et qui enterrent donc les signaux radio faibles quelques m tres autour du v hicule. J en arrive cette conclusion pour trois raisons : 1- une batterie isol e ne diminue pas le probl me. 2- D brancher l antenne fait dispara tre le probl me 3- la cassette n est pas affect e.

J ai fait une petite visite chez mon concessionnaire Chrysler, tant donn que le v hicule est neuf et garanti. Apr s avoir inspect le moteur, ils n ont rien trouv . Le c blage des bougies et ces derni res sont de type r sistifs, install s de s rie, donc un point d limin . L ordinateur de bord est d j prot g contre les EMI (electromagnetic interference) dans sa conception, selon les ing nieurs de Chrysler. Les mises la terre des diff rentes pi ces du moteur sont d j bien faites lors de la fabrication.

Je me suis fabriqu une petite antenne (dip le de 4 pouces de longueur) au bout d un long c ble coaxial branch sur mon r cepteur radio, et je me suis promen autour du v hicule en coutant l interf rence re ue, afin de localiser plus pr cis ment la source de bruit radio. C est en approchant l antenne du circuit d allumage (cap distributeur, c bles de bougies, bougies, coil) que je capte le maximum de bruit. En fait, l augmentation y est radicale. On m avait sugg r que la source de bruit pouvait tre la pompe essence, mais en y approchant la petite antenne je ne re ois aucun bruit. J ai tent aussi de d brancher l alternateur; le probl me reste pr sent.

Existe t il des dispositifs de filtration qui peuvent tre install s sur le circuit d allumage? J imagine que d autres amateurs ont v cu le m me type de probl me avec leur voiture; y ont-ils apport des solutions? Une recherche dans les newsgroups sur internet n a rien r v l de pertinent pour ce type de probl me. J ai aussi consult la litt rature radio-amateur (Radio Interference handbook) sur le sujet, et tout ce qu ils sugg rent comme piste a d j t tent , sans r sultat. Si vous avez une id e pour mon probl me, vos suggestions seront tr s appr ci es.

You are right on 1 count, counsel. I meant "cops" as in plural. But since my "s" key did not take, I graciously admit defeat on this specific issue due to my own error of not carefully rereading my post before sending.

I stand by my post that "most" readers on this NG are quite aware of the law. As you pointed out, Jason MAY not be one of them, but for the most part, I do believe the posts are usually semi-literate:).

The "listening but not talking" is indeed a valid alibi, as we are innocent until proven guilty. So unless Jason states he is not a ticket holder or is caught transmitting on an unauthorized freq., it most certainly does wash. Anyways, motion withdrawn.

Greetings!

If you're talking about "Up north" as in a yooper' [ya'!] - yes.

There are problems with jelling of diesel fuel when exposed to high
humidity and freezing conditions.

There are also a lot of problems with gas-engine vehicles too. Many
Canadian dealers, as well as the upper midwest - offer engine block
heaters to handle the extreme cold. In fact, you can get it from the
factory that way.

You plug it in overnight, just remember to unplug before you leave.

Greetings!

The antenna is a 1/2 wave wound - all those coil turns make the
antenna appear as a 1/2 wave.

The round part on the bottom, is a toroid. It too has coils wrapped
around it.

The part helps provide a low SWR for you, all you have to do is
connect it.

One hint, may not work well on a vehicle with a lot of metal. It's
better to use a regular CB antenna instead. A regular CB antenna uses
metal, the antenna you have, performs better if you don't mount it to,
or use it around, any metal. Can cause problems with matching it in
[SWR] and working.

The antenna performs poorly compared to a regular CB antenna, but at
least you have an antenna which is better than nothing at all.

Try these news groups alt.radio.scanner and rec..radio.scanner. The new Uniden scanner 245 xlt is a trunker and is getting good reviews. I have a 235 and it performs well but could use some more power on the volume. Radio Shack new trunker is getting good reports too. But you should check and see what is being used. No one in my area is using a trunked system yet so the extra money was a waste so far.

New scanners cannot be modded for cellular so don't fret about it. Most are going digital and you won't be able to pick them up anyway.

try www.bills2way.com he has some good prices or ask on the NG mentioned above. They will point you to some good sources.

170. Re: Texas star mod?

Newsgroup: rec.radio.cb
Date: 1999-12-02 00:00:00 UTC
From: CitySlicker <**mannod**@concentric.net>
Message-ID: <827995$pjv@journal.concentric.net>
Source record: 13619

You must be a linear amplifier expert. :^) Tell us more.

Sean wrote in message ...
:Toll's suggestions are all valid, depending on how far you want to get into
:it. For most applications, just changing the power wires and bypassing the
:factory fusheholders will show a measurable increase in performance on the
:Texas product line. I do recommend running an in-line fuse, but this
should
:be mounted as close as possible to the power source (battery).
:
:From my experience, here is a basic guide as to what gauge wire should be
:used with the various amplifiers. Keep in mind that these are for
:relatively short lengths of wire (appr. 10' - 12'). They are the MINIMUM
:allowable to obtain maximum performance from the amplifier. Longer runs
:should go to the next heavier gauge to minimize voltage drop. Amplifiers
:with bias (Texas Star) will pull more current than "competition amps"
with
:no bias (Dave Made, Pirate, X-Force, etc). Amplifiers that are being
:driven harder via built in drivers or an external driver amp will also pull
:more current. They should use the next heavier gauge wire down the list.
:Take this into account when selecting the proper wire for your
installation.
:
:ALWAYS place some type of fuse / breaker at the power source to protect the
:vehicle from an electrical fire. Under competition conditions, if your
:worried about the fuse possibly current limiting the system, use a slightly
:bigger fuse than necessary. This will still blow should a direct short to
:ground occur and may save your vehicle from becoming a rolling flame
thrower
:or even your own death-trap.
:
:How much is you or your families safety worth ???? I know people that have
:completely lost their vehicles due to fires started from poor radio /
:amplifier installations. I had also specifically warned another local
about
:his poor installation, yet he didn't correct it. He did end up having a
:car fire because of it. The scary thing is that his kids were strapped in
:the back seat in child seats and he couldn't get them out of the car very
:quickly. Luckily, nobody was hurt. Things like this DO occur, so don't
be
:dumb or cheap. (Sorry to rant so much, but this is VERY important.)
:
:2 pill (1446's, 455's, etc) = 10 gauge
:

:2 pill (2290's, 2879's , various Motorola's) = 8 gauge
:
:4 pill (1446's, 455's) = 8 gauge
:
:4 pill (2290's, 2879's, various Motorola's) = 6 gauge (4 would be
better)
:
:6 pill (2879's, etc) = 4 gauge
:
:8 pill (2879's, etc) = 2 gauge
:
:10 or 12 pill (2879's, etc) = 0 gauge
:
:16 pill + (2879's, etc) = Double 0
:
:Also keep this in mind when looking to purchase amps. If the wire gauge
:coming out of them is measurably smaller than what is specified here, the
:manufacturer is cutting corners and costs. Where else are they saving
money
:at INSIDE the box ??? Hope this helps and be safe out there :) Sean
:>
:
:
:
:
:Toll Free wrote in message ...
:The best mod to do to it is to put larger power wire on the input, as well
:as kill the stupid fuse block.
:
:The next best thing to do is change the value of the resistor that supplies
:bias to one that will allow you to run a bit higher voltage. With slightly
:higher resistance, you can run 15 volts on that amp just fine, and it will
:give you mo power output.
:
:Don't ask me what value of resistance because I have found each amp to be
:slightly different, as the value of beta of the transistors is different in
:every case.
:
:However, you NEVER should have to go to 100 percent higher... In between
:the original value and about 75 percent is the biggest change I have had to
:make.
:
:Also, the electrolytic on the 12 volt buss should be increased (voltage)...
:They have some marginally rated caps that need to be bigger when running
:more volts / watts.
:
:Their are others, but if you don't know how to do them, I don't suggest
:trying to follow someone else's instructions. These that I gave you will
:help.

I agree that the majority of shops are VERY crooked. You would not believe how much work i get out of the shops in that area. I recently had a guy come in that paid over $180 to have two 2879's put into his Texas 350. At that rate, i could retire pretty quickly.

I should start taking digital photo's of what some of these radios look like when they come in. I've got the digital camera and a BIG scanner, too bad i'm not "puter literate" !!!! Sean

This must be the CB Shop that I heard a truck driver last weekend speaking
of.
I was going through West Memphis, Ark. fixing to cross the river into
Memphis,
Tenn. Then I heard a driver telling another driver that he hooked his radio
up
backwards. He took it to the shop by the truck stop and the manb charged
him
250.00 to replace a small part. These are the shops that give the good
shops
bad names.

Source record: 13626

I like these radios overall, but they do suffer from inconsistent soldering and smaller "lands" than on other boards. This leaves less solder material to make contact and the greater potential for bad joints due to vibration. I am still working out various mods on these radios, as i don't get much time to experiment too often.

Overall, these radios do more power than the current Galaxy models with dual finals. They use a different digital echo than the 73's or 99's. I prefer the standard analogue echo for best tonality, with the digital echo from the 73's / 99's next and then the digital Ranger echo. The receivers are typically pretty KILLER in terms of sensitivity. If it's quiet out, they will hear things that only the early 858 SSB chassis could have picked up. With the current noise level that exists, the sensitivity advantage is of little use right now though.

Be careful as to who you let work on your radio. Most shops are major hacks. If they do good work, they will offer a GOOD warranty on it. Sean

>

Depending on the size of the truck motor and the location of the unit, it can be very difficult and sometimes impossible to restart one of these in the dead of winter. I'm referring mainly to the large log haulers and construction or mining equipment that is larger than your average truck/dozer. These units have tires 10-20 feet tall.
In places like Alaska and the extreme northern latitudes, one of these large motors is never shut off in the winter. Once the motor cooled it would almost never turn over again until the spring thaw. You sometimes build fires under them to try and get the oil moving but this doesn't always work.
Your average tractor trailer motor will usually be left running unless city ordinances restrict this. There are many places in this country where the locals won't allow you to keep a tractor idling overnight in the winter or summer. I can assume it has to do with the pollution this causes moreso than the noise.
Most, if not all, rigs have a fuel return line from the motor. This returned fuel has been run through the warm fuel pump and is primarily responsible for keeping the fuel from gelling in the tanks. This is not what the return lines were primarily for but it's a good secondary benefit although not nearly successful enough. The fuel still manages to gel in the tanks sometimes.
I personally don't shut the truck off unless I'm only gonna be gone a couple hours or so. I have never had a tank gel on me but I have seen it happen to others and it's not a pretty sight to see a grown man or woman cry.
The hassle is being out in -20 to -30 degrees weather with a cold wind blowing trying to thaw the fuel lines and replacing the fuel filters. Worse yet is by the time you do get things thawed out

enough to flow, your batteries are too cold to crank the motor long enough to pick up the fuel again. Now, you've spent the better part of two hours or more freezing your ass off just to have to find a phone to call a tow truck out. And this is a lucky scenario. Sometimes you have to wait in the frozen truck for help to stumble upon you. Many drivers, even wrapped in blankets, have gotten frostbite from being stuck in the middle of nowhere waiting for help.

So the short of it is, I'll gladly spend the money on fuel to keep my stuff warm and comfortable.

BobC

In the last few years, much attention has been given to the
noise pollution created by Jake Brakes. Most truck makers have toned
the exhaust noise down to a dull "put" "put" "put". There are of
course those that must modify their rigs' exhaust system to make
more horsepower but these are far and few between anymore due to
noise laws around the country.
I confess that I am one of those guys that can still appreciate
the great sound of a healthy motor and jake brake coming off a hill.

I'm having trouble envisioning this, but it sounds like a marine antenna. Basically the collective antenna, mount and coax are the antenna and provisions are made to match this to your radio's 50 Ohm antenna spigot. Normally this is accomplished by a tuning stub on the coax line at the PL259 connector. Yours sounds like a slightly different approach. I've used a marine whip only once. It worked okay, but the same whip mounted permanently worked better in every regard..

192. Cobra 148 Swing mod!

Newsgroup: rec.radio.cb
Date: 1999-12-03 00:00:00 UTC
From: justin535@aol.com
Message-ID: <19991202214159.23932.00000246@ng-co1.aol.com>
Source record: 13641

just ,wondering what swing mod (if any) you guyes preffer for the 148GTL....Here are some examples:

1.cut or remove violet wire from TP 8, now solder this wire to the striped end of D44 . Now turn the radio over and locate VR10 {am power adj.} Once you find VR10 picture it in your mind and turn the radio back over to the solder trace side and solder a jumper from the left leg of this pot to ground (solderside up) . Now adjust vr 10 for a low dead key for high swing. NOTE THAT THE FRONT OF THE RADIO IS FACING YOU WHILE DOING THIS MOD. iF TP8 WILL NOT WORK TRY TP7 INSTEAD.....

2.connect the violet wire to 12 VDC at the on off switch instead of the diode. Also at VR 10,I cut the trace that supplies its voltage(the trace closer to the radio center--the only trace long enough to cut and bridge) then bridged the cut with a 10K resistor. Dead key is set at 3 watts swinging 26 watts (on my meter-my buddies Bird meter shows a swing of 38 Watts) AM & SSB

3.look in side your radio,there are to wires next to audio transformer,usualy purple and yellow,they are on tie point 7 and 8,take a 100uf 25 volt capacitor short it with a 82 ohm resistor,put this in line with the line that came off tp8put negative side to the board,then take the other wire and solder it to jp1.this is a super mod.it should drop dead key to about 2 watts and bring your swing to about 20 to 25 watts.this is exelent for driving a box.if it doesnt work well like i explained swap the wires.the super mod should be on the tp that goese to the driver.and Q is the scematic symbol for a transistor.

Yea Me to Quement was grand!
The son opened a cb and scanner only shop for about five years accross the street. He closed it down last year to concentrate on a web based shop.
He is at www.talkgear.com and he is the
most honest guy I know. He will beat prices and ship free over 100 purchase.

I got an email about the "old guy in San Leandro. I disagree with you on your quoteing him the best. He is a nice guy and has recently closed shop. But his prices were high and his tech work average. He made his buisiness on amp sales and since the web has matured it has put him out to pasture. Like I said nice guy but very few people have called him a
affordable guy.
Bills two way in Gilroy is web based and he to has great prices and is a good guy
bills twoway.com

Thought I would give a shout out.

Have a great day...

This must be the CB Shop that I heard a truck driver last weekend speaking of.
I was going through West Memphis, Ark. fixing to cross the river into Memphis,
Tenn. Then I heard a driver telling another driver that he hooked his radio up
backwards. He took it to the shop by the truck stop and the manb charged him
250.00 to replace a small part. These are the shops that give the good shops
bad names.

199. Small update on power cords.....

Newsgroup: rec.radio.cb
Date: 1999-12-03 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <AZI14.382$AM2.21586@news.corecomm.net>
Source record: 13648

I received quite a few emails on this, so i'll post the basic responses here and kill a bunch of "ducks" with one stone :)

Yes, radios do suffer power starvation also. This can be verified by watching how badly your meter or display lights dim out when keying or modulating. Keep the factory power cord as short as possible. If you need a long run, cut the factory cord a few inches past the fuses (leaving them intact) and CAREFULLY splice in heavier wire. This is especially true for radios like 2960's, 2970's and 6900's. There are some aftermarket power cords that are WAY too thin. They should be AT LEAST 16 gauge or heavier for a standard CB type radio. Exports can make use of at least 14 gauge or so. The higher the carrier level and power output of the radio, the heavier the wire it needs.

It is not abnormal for the radio to still dim out slightly after doing the power cord upgrade. Many radios have insufficient size traces to carry the incoming voltage to the modulator / final section of the radio. While this too can be beefed up, be careful as to what you attempt. ANY mod should be done one step at a time while verifying proper operation along the way. If you goof up, you will know right away and be able to backtrack to where the mistake was done more easily.

If attempting any of this, ALWAYS make sure you pay attention to color coding and polarity. It would be a real bitch to get done with the mod and hook your radio up backwards. Believe me, it has happened more than once......

Take your time and triple check everything. No working on stuff when your tired either. Even if it was wrong, you might not be sharp enough to catch it. Sean

None of these are REAL safe. The purple wire trick will generaly gat you more output, But it is riskey. also the most wattage you will see out of that radio is about 7 on a bird 43 on am, you will almost double that number when you apply 12v to the purple wire, but don't say I did'nt warn ya.

My first suggestion would be to do a thorough study of the owner's manual. If nothing is there, get the tech manual.

Every pc that has a lock code that I have encountered has always had a way to clear it. It might be a hidden pushbutton or switch, a combination of switches that need to be pressed at power up, a place where a component or pin needs to be jumpered to ground momentarily etc.

> Ah, here we go again. What yard belongs to you, Jeff? Are you going
>to start the nonsense that ham operators, who also own a CB radio,
>cannot post to this newsgroup again?

to be specific, the cb ng as opposed to the ham ng's and i have NEVER said it was MY yard as to mean that i own it. if you and i were arguing this point, i would be refering to it as "your yard" and "my yard". most of the time, if i were talking to a specific group of people like the RF police for instance, i would refer to it as "our yard" and "your yard" in the collective context.
this was all in reference to the question about why is a certain segment of the ham community, (the disagreeable segment) on this ng instead of one of the other ham oriented ones? the particular segment refered to, it seemed, never had anything constructive to say. i would read through all of the posts and not one of this particular segment had anything but condemnations or insults to say and, coinsidently, they were always thrown at people who posted something in favor of or pertaining to illegal operations.
there have also been hams on there who have been helpfoll and answered questions from the legal cb community and had the sense to ignore the out-band, power meisters. go back 6 or 7 months through your archives and see if i have EVER attacked one of them. go back and also look to see if i've ever attacked a ham who came on in a neutral non-condemning manor and have debated the issue in a fair and even handed fashion.
go back and see if i've ever attacked ANY ham who EVER came in WITHOUT a smart-ass attitude and spoke about ANYTHING.

> And exactly who is the "WE" in your message? I have not seen a single
>CB operator in this newsgroup agree with your negative comments about
>ham radio operators. You are alone, Jeff. There is no "WE" when it
>comes to your opinions.

you haven't been reading ALL of the posts from others that don't share your views.
as a friendly suggestion, try reading ALL of the posted responses from ALL of the cb / out-banders who've been shot at by that particular segment of the ham community.
it may shock you to find out that i'm not as alone as you think.

>So, what you're trying to say is that that you're just an innocent
>victim that was minding your own business, innocently posting to this
>newsgroup, and all those ham operators that you talk about in your
>messages just decided to attack you out of the blue. All of those ham
>operators came at you in a threatening manner, so you had to attack them.

in essance yes but it hasn't been only me that has been attacked. it's everyone else who doesn't cling to the opinions of that segment of the ham community.
you make it sound as though that segment was happily whistling dixie when, all

of a sudden, they were blind sided.
like i said, go back and read ALL of the posts and not a select few.
there have been some, yes. i have even gotten private, non-posted e-mails from hams that i've never heard of on this ng. one had threatend to shut my F@#$^& ASS down. i had never seen his ID'er here before. i let him have it by return mail also but i havn't heard from him since. it's been several months.

> Nobody disputed any of the facts that Martin gave, mainly because none
>of the facts that he gave disagreed with anything that we said in this
>newsgroup.

not altogether true.
the RF police line has been that according to ITU treaties, the cb frequencies were locked in at 4 watts and 40 channels and the out-bands were forbidden lands. this was not what was in Martins tutorial that you've just agreed was correct. as a matter of fact, the opposite is true for the eastern hemisphere.

>What we disagreed on was Martin's opinions of you. And I
>disagreed with your attempt to use him in an attempt to discredit the
>ham operators in this newsgroup (which you failed to do).

Martin's opinion of me is different from yours because i havn't treated him the way that i've treated you.
WHY? you might ask?
it's because he hasn't treated me the way you and yours has.
i tend to treat people the way they treat me.
i wasn't using Martin to discredit the hams in this newsgroup. the hams in that particular segment have done that very well all by themselves.
all i did was to provide the evidence of this.
how can you discredit anyone with facts. you can't. all you can do is show how they have discerdited themselves or, at the least, have professed to have all of the facts when, in reality, they had been wrong about frequency and power assignments according to the ITU treaty.
their position had been that cb is locked in at 40 channels at 4 watts, case closed. Martins references said otherwise.
did you happen to notice the tone of Martins letter? no where did i detect an air of eliteism, snobbishness or condemning attitude. this is why, even though he's a ham, i didn't blast him. i treated him with the same respect as he afforded me.
the other segment gets the same respect from me as they afford me also albeit a whole lot less. you get out of it what you put into it and they did get what they gave.

>However, you said that he presented "facts that showed that, in some
>cases, they were wrong." Please show me where he presented any
>information that was in conflict with anything I said about the FCC and
>ITU in this newsgroup.

i have not seen ANYTHING in this ng from ANYONE except Martin that acknowledged the fact that the ITU treatys allowed cb or higher power limits between 27.405 and 28.000, as a matter of fact, all have denied or ommited this information.

> Okay Jeff, show me one message where I have ranted about CB'ers. All
>of the messages that I've posted in the last ten years are still
>available at Daja.com (www.deja.com). I challenge you to find a single
>message where I have ranted about CB'ers. In fact, I challenge you to
>find a single message where I have ever said anything negative about
>CB'ers in general.
>

just for the sake of clarification, do you define cb'ers as, (ch 1--40 @ 4 watts max), or do you define cb'ers as, (26,000--27.995 @ 6+watts)?
there may be a misunderstanding between us as to the definition of the term "cb'er".
i will defer a response to your chalenge until i hear from you. please post AND e-mail me your definition. then i'll do my research as it would be useless if we have put 2 different meanings to this term.

>That is a lesson that you still need to learn.

believe me when i say that i HAVE learned that lesson well here.

> I don't go around making negative comments about groups of people,

regardless of your political affiliation, do you agree with the GROUPS of people of ALL political persuasions? is everyone right? have you NEVER disagreed with anyone? if you feel that you're right about something, and someone disagrees with you. in your view, they MUST be wrong which puts them in the negative end of the debate from your point of view. any agreement is positive just as any disagreement is negative. it's just a matter of ones point of view and what the facts may be. there is no front without a back, no positive terminal without a negative one and the whole world can't be in daylight at the same time. to beleive anything different is one dimentional thinking.

>Ah, here we go again. What yard belongs to you, Jeff?

one more thing on this subject.
if you re-read the post and all of the other posts where i refer to the word "yard", you'll find that i have never laid claim to the "yard" as my own in the literal sense. >the supporters of your position have brought the fight here to our <<<<<
>> yard
you are now discussing semantics. if i could actually lay claim to this ng as "my" yard, we wouldn't be having this conversation right now. this is not meant to be offensive to you personally but if this was "my" yard, i would be able to dictate that all who do not agree with me must leave. and as that hasn't happened yet, then i must obviously realize that this is not "my" yard. this was meant as a general illustration to distinguish between the cb and ham ng's.

>> i don't post inflamatory comments here, i just answer them.

let me clarify something on this.
what i say here may be and a lot of times is inflamatory. i don't pull the subject matter out of the air though. it is in response to inflamatory things that are written about others or myself concerning the 27.XXX mhz hobby in

general.
what kind of response do you think i would receive if i were to go to rec.radio.amateur and start to condemn the hams there using eronious information, threats of FCC action that are so outlandish as to defy belief, attack people mothers and how they raised them, whether or not they were potty trained, their education, spelling, grammer,(dirty language not withstanding), questioning whether or not the were sexually abused by a male relative, comment on their maturity soley on the basis of the equipment they use, berate them for not having a higher class license, (anologous to not having any license at all), call them idiot, asshole or stupid for using the band of their choice what ever it may be, spam their questions or comments with condemnations and insults that have nothing what so ever to do with the subject at hand, tell them what they should and shouldn't do, try to intimidate them like the ham who said that he was going to submit to the FCC for further action, a list of all posts and e-mail addresses having subject matter pertaining to illegal ops, literally threaten people from around the world with the wrath of the FCC like the ham who threatend the guy that asked about a cb linear but didn't notice that his e-mail address ended in "U.K.", the last time i had checked, the FCC wasn't a division of interpol. and the list goes on and on. do you honestly think that the hams on that ng would welcome me with open arms and hand shakes? i seriously doubt it.
last night, i answered your post about my backing off from the ham community with my return fire to a lot of the napalm that has been comming our way.
you said that i could argue and fight with anyone that i pleased as long as i didn't lay insults on you, the ham hobby or community. i responded that the pace and direction would be set by the one that throws the first stone, to paraphrase myself. and, as long as you didn't get involved, it was fair to leave you out of it.
if a ham of the negative 27.415 + opinion were to come on and start to throw around insults as to our operating practices and start with the holier than thou attitude by virtue of his ticket, should my response be to him that his hair looks funny or his arms are too short? no, as it would be off from the subject at hand which would be radio and by who's authority did he come here and start ordering people around?
don't even try to say that, that didn't happen on this ng because it did all of the time up until several weeks ago.
i also told you that yes, for a while in the begining of the war, i had used the term "ham" generically until a ham came on and pointed out that not all hams agree with the position that the "RF police" hold on to.
to this, i responded by coining the phrase "RF police" to distinguish between the hams who do and don't agree with the "straight arrow rule book" opinion.
(for the sake of peace, i did not use the terms used last night.)
as you have said your self, there are good and bad people. this can also be applied to people of differing opinions.in your opinion, i may be wrong for supporting the out-band position. in my opinion, i don't agree with your opinion. this doesn't mean that either one of us are bad, we just don't agree.
where i get VERY opinionated is when hams of a differing opinion from mine / ours get on and start in with the attacks mentioned above and below.

what kind of response do you think i would receive if i were to go to rec.radio.amateur and start to condemn the hams there using eronious information, threats of FCC action that are so outlandish as to defy belief, attack people mothers and how they raised them, potty training, their education, spelling, grammer,(dirty language not withstanding), questioning whether or not the were sexually abused by a male relative, comment on their maturity soley on the basis of the equipment they use, berate them for not having a higher class license, (anologous to not having any ticket at all), call them idiot, asshole or stupid for using the band of their choice what ever it may be, spam their questions with condemnations and insults that have nothing what so ever to do with the question at hand.
have a good night.
jeff

I've tried that. Due to all the hills, trees and buildings,
I can still only get 1 1/2 mile range with a 25ft tower.
Even with a CB it takes 50 watts to get across town
where I live. I'd like to at least get the elusive
2 mile range that the manufacturer promises.

In a word yes. If the k40 is a mag mount set it in the middle of the stove or on the side of the fridge. My first base set up was a K4o mag mount stuck on the side of a Florescent light fixture with a 40 channel GE base and a JB 75 modulator. I talked all over the country on this rig. I also blanked TV's and kiied to Musac system in the DR's office below me. This is something you will need to think about
Good luck

>I agree that the majority of shops are VERY crooked. You would not believe
>how much work i get out of the shops in that area.

Lately I've seen alot of radios getting 12v jumps and the owners are charged $69- $109 for a "Super Mega Tune" for simply running a straight wire off the regulator to the final(s). If the final(s) aren't gone, already, they sound like crap and run hot as a firecracker. Sometimes they do even less output than the stock radio.
If you're in Va., stay away from the following CB shop exits: 89, 104, and 133 on I95, and Emporia. There is one decent shop at ex 98.

True. However I don't want to be accused of being an RF cop.
There are enough of them. While most folks know 28.000-29.700
is a ham band, I felt it necessary to remind the others. If
someone wants to get busted, ain't nothing I can do about it.

You Know You're In A Redneck Hospital When ...

The ambulance is a mule driven buckboard with a spinning lantern.

Anesthesiologist in bib overalls, feeds you a clear liquid out of a mason jar.

Your proctologist, who watched Deliverance 200 times, asks you if can squeal like a pig.

Surgical instruments include a stick of dynamite and a chain saw.

Immunizations are worn fanny-packs, full of lizard's feet, owl's beaks and pig's ears.

Double by-pass surgery is only done when it's shown on The Learning Channel.

You have a choice of walkers, with or without a gun rack.

The bill is figured either in dollars or chickens.

225. Coax Length for mobile

Newsgroup: rec.radio.cb
Date: 1999-12-03 00:00:00 UTC
From: network55@webtv.net
Message-ID: <18114-3847EF4C-19@storefull-226.iap.bryant.webtv.net>
Source record: 13674

Prompted by a phone call, I will post one time. We recommend specific coax lengths in mobile installations for a more constant field strength. The impedance of a mobile antenna system with insufficient ground plane will change with outside reactance. That is to say; while the vehicle is moving or it is moved close to large metal objects, the antenna impedance seen at the transmitter end of the coax changes. This is the reason for changes in watt readings when side by side shoot-outs occur. Certain lengths of coax will keep these changes to a minimum assuming that the antennas on the roof are 50 ohm. I don't dispute any of the other posts. Happy Holidays from Fifty Five in Fla.

Thanks for the reply. I take it that the K40 has to be on something
metallic? What about just setting it on top of mobile CB?

Thanks again.

Nice,

Here's a mighty creative fallacy. Certain coax lengths can prevent
"mutual impedance" variation caused by varying proximity metallic
objects.

I am off to shoot myself, good bye world.

Bob.

Ps. Before I go, you should know the "correct" coax length can also:

Make you more attractive.
Lessen your chances of cancer.
Increase your salary.
Increase intelligence.
Increase sperm count.
Regrow hair / Remove hair
Cure headaches.
Help you lose weight.

Among hundreds of other things.

Now you're talking though you'll have more hurdles to overcome.

Do a search on: tennamatic

and see if you come up with anything.

Not sure this would be of much interest on this ng as it's maybe really
only suited to multi-band antenna's.

Are you considering the phase detector route?

Happy to discuss this further here or via e-mail.

Phil / UK

If you haven't shot yourself yet......

You will.....

You forgot this one.............

A repost from the past:

****

After much discussion on what coax length is proper to use on a
mobile installation, i decided to sum up my thoughts on this subject.
Before i start, i have to say that there is no such "proper" way that
will suit all installations. Each method has its own advantages, and
disadvantages. Each method is neither right or wrong.

These are the three methods discussed here.

1. Using the shortest length possible
2. Using an electrical half (or even) wavelength piece of coax
3. Using an electrical three quarter (or odd) length piece of coax

that is 18 feet long

Each installation of an antenna may, or may not, take advantage of
all of the individual properties of these coax lengths. It is up to
the operator to determine what best suits him.
.....

Method ones advantages:
1. The lowest loss of all methods. *There is hardly any loss in any

method to begin with

Method one disadvantages:
1. If the shortest length falls around the nine foot area, and if this
piece of coax becomes an acceptable counterpoise to the antenna,
then a voltage maximum will occur at the radio. This will cause a
high SWR reading at that point.
.....

Method two advantages:
1. The load is mirrored at the radios end. This gives the most
accurate SWR reading at the radio.

Method two disadvantages:
1. Because the load is mirrored at the radio end, a direct short or
open at the antenna will result in an infinite SWR at the radio.
Whereas any other length other than this length will show a less than
infinite SWR.
.....

Method three advantages:
1. Load variations at the radios end are spread out. This increases
the SWR bandwidth at the radios end. *this does not change the
actual SWR
2. This length, if it becomes an acceptable path for a counterpoise,
will present a voltage minimum at the radio. This will have negligible
effect on the SWR at the radio.

Method three disadvantages: none
.....

It should be pointed out that the first thing you should do is
resonate the antenna at the desired frequency, no matter what method
you choose.

It should also be pointed out that any length of coax can be
used. Its advantages are: The most convenient of them all.
.....

Here is the relationship of the impedance shown at the radios
end of the coax, when using a 1/4, 3/4 or 1-1/4 ect. feed line.

Zms = impedance of matching section, or coax Z
Za = antenna resistance
Zl = line impedance, or what the radio sees

Zms = \/ Za Zl

Or the square root of (Za times Zl) equals Zms

So for example Za = 25 ohms, Zms = 50 ohms, then Zl= 100 ohms
or an inverted but identical match

.....

I have not found a way to express the broadening of the SWR at the radio with a quarter wave transformer mathematically, but i have found the reason.

When the antennas resistance at resonance is less than the characteristic impedance of the coax, this being the normal case, and if we move off the resonant frequency we find this.
Because of the inverting action of a quarter wave matching section, the added inductive reactance at the antenna, when you go higher in frequency, is partially canceled by the added capacitive reactance, that comes from the former quarter wave section, that is now more than a quarter wave matching section.
The same inverting action takes place if you go lower in frequency. In this case the added capacitive reactance at the antenna, is partially canceled by the added inductive reactance of the now less than quarter wave matching section.
One thing should be noted. This inverting action that takes place (adding Xl with < Fr),(adding Xc with >Fr) with a quarter wave matching section inverts itself when the impedance of the antenna is greater than the characteristic impedance of the coax. In this case just the opposite action takes place. In other words.
When the impedance of the antenna is lower than 50 ohms, the inverting action works to increase the bandwidth at the radios end. When the impedance at the antenna is greater than 50 ohms, the inversion that takes place works to decrease the bandwidth at the radio. Once again, normal resonated antennas on mobiles are somewhat lower than 50 ohms.

Message-ID: <829b72dic1@oak.prod.itd.earthlink.net>
Source record: 13681

I gotta get my two cents in here. And I hope it's worth at least that much!

First off, coax length will not affect anything, if everything is perfectly matched, the moon is in phase, and your cat didn't didn't leave any juicy tidbits for the dog in the litter box. Well, OK, it's not lossless, right? So anything flying up and down the cable does lose just a bit.

But what people always seem to forget is perfect systems aren't the norm. For example, cut (1/4 wavelength) pieces of 75 ohm cable are used to make a harness for dual antennas. Why 1/4 wavelength? Well, length DOES matter. Without going into the match involved, I think it works out that a 1/4 wavelength inverts the 'apparant' impedance of a mismatched point around the impedance of the cable. So, try to just tie two 50 ohm resistors in parallel, what do you get? 25 ohms. So why does 2 antennas work? Well, the 50ohm antennea is fed by a 70 or so ohm cable of 1/4 wavelength. So it is seen as over 90 ohms at the other end of the coax, but there are two coax pieces tied together so it's like two resistors in parallel or close to 50 ohms.

Now another point to all this, is that the 'meters' that everyone seems to be using to do this comparison are NOT power meters, regardless of what the guy at Radio Shack or HRO or wherever told you. (Well, ok, some may be, but if you paid anything reasonable for your meter, forget it!) They are VOLTMETERS! They are only accurate, or as accurate as they will ever get, when they are plugging into a perfectly matched system and the load is purely resistive. But they do fine for most work.

HOWEVER, when you get a 1.2:1 SWR, that's not only an indication of reflected power, but if you were to be able to see down the cable with an accurate voltmeter, you would find that the voltage varries up and down by a ratio of 1.2:1 as well. And so would the current (but current peaks would be at voltage mins, and vice versa). If you had 2:1 SWR, you would be able to read voltages that are TWICE what they are at other locations.

Don't believe it? Take say 5 short pieces of cable and barrel connectors,

and set up a small rig to two dummy loads on a "T" connector. That will give
you at LEAST a 2:1 SWR. Now put your meter in the line and do quick
test for power at each of the barrel connectors. (Please keep in mind that
your barrel connector/cable assembly is going to be crap for impedance
even under the best of conditions, but this should get the point across. And
no, I haven't done it, but it SHOULD work!)

Remember, all the meters for power in the rig are just voltmeters, not real
power meters. And antennas and cables are not perfect.

The bottom line is the length of the cable doesn't matter, if everything
else is ok. But it CAN hide things when things are not.

Mike

The antenna will work very,very poorly and slightly better with 4 108"
counterpoise radials but still very poor.

In addition:

Take these typical voltage variations that you speak of. Couple them
to a typical SWR meter and you will see different readings. Why? Most
all SWR meters are less sensitive as the voltage gets lower.

And what would make the 2879's Foxie uses need more drive to perform properly? To me when the amp gives me good output with the least amount of drive it then is right, until I would keep working.
Just my .2 $

249. Need info on Lafayette 2400FM

Newsgroup: rec.radio.cb
Date: 1999-12-03 00:00:00 UTC
From: "Dawn M. Burge" <fantasy@fred.net>
Message-ID: <B7%14.404$kU6.337392@news.abs.net>
Source record: 13698

I have a lafayette 2400FM with a resistor (R47) burnt.

The radio seems to be working ok but has low output on SSB.

Does anyone have info on this radio. I need the value of the resistor (R47)
and what part of the circuit it is in.

Thanks
Richard

Please Email me at RCROSS@FRED.NET.

On my '91 Exploder, just forward of the luggage rack, there is a plastic plug cap. I pulled the plug and installed an egg-type antenna mount. Later I put a Tullos Ball mount there for better watt handling and sturdiness. See if you have one on yours. You won't need to drill because the hole is already there. Have fun...

You run this risk with what ever kind of equipment you install in anything.
So, the answer here folks is, buy insurance. That is why you need to pay out
some of those hard earned bucks to keep yourself and shop covered in case
something like this happens.

CB Radio repair is not really a hobby anymore. Just like car stereo systems
aren't. So when we all read the post about wanting something for nothing and a
shop pipes up with a comment like, this is how we make our living, think about
all the expenses a legitamate CB Shop must incur to keep you communicating.

Anything installed in a vehicle can cause problems if not carefully and
thoughtfully installed. I am not sure its the shops that cause the problems
here. I am not taking up for any of us. But I can say I have stepped into a
few vehicles, trucks, pickups and cars and seen some real iffy installations.
It wasn't done by a shop. It was self inflicted.

I show them the pitfalls and then let them decide whether or not they are going
to improve the operations. Lets just pop out the real issue. Some people will
not pay someone to proffessionally install equipment. Afterall, twisting two
wires together shouldn't be all that hard? Yeah that wire not being used on
the lamp should be good enough :)

PS. We are one of those shops that pay out lotsa bucks every year to protect
us against anything that might happen. God forbid

God Bless and happy holidays.

They only have a part of the button push combinations, which don't work on this radio. I have since found that to get it working on all frequencies and modes, a resistor has to be added across the CPU. It now covers 26.065 - 28.315 and 40 ch UK FM. If anyone needs the mod let me know.

Hi,
I may try the wire reflector.I wanted to use a horizontal reflector to reduce wind load and make the beam a little easier to get up.I am planning to move this summer so I didn't want to put up a tower now,but wanted to play with the beam.Iheard a dx station on a moonraker built this way after I started my project,but didn't get any particulars on it.Also could not make contact with him.He had a good signal from the west coast to my east coast location so Ithink it worked well.Any way thanks for your input.

Julian,

No licensed required in the USA. Channel 19 is used by truckers and travellers, channel 9 is used for emergencies. I wouldn't rely on the unit for emergency assistance but it could make a good travel partner. Just be careful you might get bitten by the CB bug! :->

Hi folks:

I need a rubber duck antenna for a handheld cb, the type that had a bnc connector to attach to the cb. Anybody have one to spare?

This would be for a Cobra HH34, although I doubt that the actual radio model number makes much difference. If you know better, let me know that, too.

Thanks...

- Dave

It is a really great radio. The problem is, people seem to be hell-bent on making them into shitty radios with these rather dubious "swing" mods.

I'm waiting to see some proof that "swing" mods increase range. I know they don't because I've done experiments with and without. A 100% modulated carrier "carries" the farthest. Some people can't grasp the reality the the carrier serves to demodulate the sidebands at the receiving end. Turn down the carrier (regardless of how badly you are overmodulating) and you've decreased your range. Period!

MC just got on down!

Hi Stephen,

Now is not necessarily the best time to get into CB with a handheld. The sun spot activity is very high right now and you are going to be hearing a lot of skip. Trying to work skip with a squawkietawkie is a bit like trying to shoot an elephant with a slingshot. Sad really, because 22 years ago you could shoot skip with a 100mW walkie. Now there are so many high-powered stations on the band that the noise floor even on a clear channel is so high that you can't hear anything. Your best bet is to try it at night when the activity dies down and you should be able to raise some locals.

MC

Hello Richard: The greatest CB Beam Antenna web site is the MaCo site on there beam antennas, this is a real treasure on CB Beam Antennas. Its at: http://www.majestic-comm.com/maco/support/index.htm

A good book is "The Truth About CB Antennas" available at Radio Amateur Call book, at phone number 1-800-278-8477

The ARRL has a antenna book, that is also well worth the price of admission, its called the "The ARRL Antenna Book" and its available at: http://www.arrl.org/catalog/

Here's some free advise: If you are thinking that making your own beam antenna to save money, and your a first time builder ..... I stonily suggest buying a manufactured CB Beam Antenna first! The aluminum tubing, home-brew engineering, running around for parts and pieces, and testing for a first time around the horn CB Beam Antenna builder, is a lot more that meets the eye. Its like a Ice Burg, all the important and dangours stuff is hidden!

A Home Brew CB Beam Antenna can be made and will work well, and your changes for success are significantly increased if you do your home work and figure out what you want, and sample the waters. You need to read the suggested books I have mentioned, and look around at the guys who have a CB Beam Antenna up and running. I suggest just walking up to the guys door and ask him for all the poop! I've stopped by Ham Radio guys and asked them for their inputs, and most of it was worth its weight in Gold.

You will need a good antenna analyzer, MFJ, and AEA make good ones, I have both. These antenna analyzers will tell you the SWR and antenna resistance's, and reactance's.

Matching the impedance of the transmission line (The coax) to the antenna will prove to be another hurtle. The books will show this for you. Call the guys up at MaCo, they well probably sell you some of the parts and pieces.

Another good tool for beam antennas, is a antenna software program, that will show where the antennas energy pattern looks like. I use Eznec.

Let me know how you make out there, or if ya need more help.

Jay in the Mojave .... Living out here in the Great Mojave Desert, the skip comes all the way in from Texas, and it ain't so hot no more, Ten-4.

Thanks for the info MC 10kW Jesus. You are right about that skip that is for sure. But I dont mind it, would be nice to talk back however. So far just messing around on it just a little I have talked to someone five miles away. The four foot antenna helps but I am going to get an external.

From: Jay <jay123a@qnet.com>
Message-ID: <384AB0D2.434E314@qnet.com>
Source record: 13737

Hello All: Hoody do, from the Great Mojave Desert.

I am looking for a old, 1961 to 1964 or there abouts, Hy-Gain 5/8 CB Base Antenna.
I need the type that has a bell looking base insulator, and the 3 to 4 feet long tuning wire that travels up and down the main vertical element of the antenna, that has 3 plastic supports.

The popular Hy-Gain Penetrator 500 evolved from this antenna I am looking for. The later more popular Hy-Gain Penetrator 500, that I am not looking for can be seen at Woody World CB Gazette, click on the "Reader Mail" on the left hand side, its at:
http://www.cbgazette.com/gaz2.html

I can sent you a .jpg picture of it. I would like buy this antenna or at least have a copy of the Hy-Gain assembly instructions for this type of antenna.

Thank you, a hole bunch.

Jay in the Mojave

289. help for new cb user?

Greetings!

The C190 mod is for less RFI. [below]

The R124 R126 combos change the tone to a higher fidelity.

The C102 has very little effect on impedance to the next stage, it's more like a tonal filter. I know we can split hairs on this, but when running a stock mike, the fidelity improves by removing this cap.

IMHO - Tone is a concern when mobile, too flat or monotone-ish, the radio never really provides to my desire to sound more like some of the other AM-only radios that have much more natural sounds to them.

Of course you can't get all that fidelity in an SSB radio, but a lot of the fidleity needed for inflections is passed thru with flying colors. It helps with the "punch" needed to get thru a pile-up.

C102 and the R124/R126 combo changes the results.

The C190 mod, affects output tank, brings in the carrier to audio - lessening the effects of audio based modulation interference.

If you re-evaluate the changes, the tone is increased to help the stock mike provide the punch needed. The C190 change lessens the effects of those changes for RFI/TVI problems that will arise if the radio is run wide open on/as a, Base.

About C190-
It was something I found out when I do repairs. People kept on tuning for carrier, but not audio. Changing this cap and the tank coil retuned, brought a lot, and I mean a *LOT* less RFI even though it's a performance hit. Audio follows carrier envelope. A lot better at the audio end and less TVI.

The Cap change isn't needed if you don't do the purple to RF choke, but there is a change thats needed if you decide to do so, and thats where C190 comes into play.

Carrier power is in the same spot on the tank coil tune, but changing the cap allows you to tune the audio and carrier together. Just try it sometime when you have a few minutes.

Acts more like the "Swing" that really should occur. Ahemn...;-)

But the main idea was to take the power off the AM regulator to increase the carrier power by the purple wire to RF choke mod. This also improves the modulation - but you still will have some

"artifacts" in the power change, promoting more TVI. The cap change,
with the power conversion from AM regulator to RF choke - you arrive
to a new value thats necessary for that cap substitution.

Just check it out and see what I'm talking about.

While Dancing with the Mouse on Sun, 05 Dec 1999 02:12:32 GMT, the

ah-yes....super mods.

They are helpful under certain situations if they work correctly. if a "mod kit" will allow the radio to dead key two watts or so, and swing maximum power, it's working correctly.Many are pure sham.

lets look at why they work at all.

AM radios that drive a transistor amps, sound cleaner, and run cooler when driven in this manner., You can merely turn down the radio, but loose allot of swing that should be available to drive the amp.

Super Mod's DO NOT give you "super mega power" not extra wattage that I am aware of. Tricking out the regulator circuit on exports usually reduces modulation even though you do see "extra peak wattage" on your wattmeter,

The reason that "mods" seem to work at all is simple, the audio modulation circuit only puts out a limited amount of milliwatts to the transmit stage. That is why in any radio, the less it dead keys, the louder the audio will be.

when you ask for more wattage from a radio, more AUDIO output is required to drive the transmitter at the same level. I'm not talking about power mics, I am talking about the audio output stage that injects the audio into the RF transmit (driver) stage, It's easy to get more RF power from a radio than the modulation circuit can handle. Tricking out the regulator in exports will easily surpass the drive requirements of the audio circuit. It "looks good" but is actually not as loud.

So, if the peak power is increased, the audio output circuit should be increased as well, and this is not easy. I have experimented with a export radio, with the audio circuit disabled, using a 5 watt equalizer to drive the transmitter. this worked very well, but is not very practical.

It's the balance of audio input and the amount of RF power that determines modulation. Both must be within balance.

my 2 cents.

Source record: 13747

Greetings!

Hi/Low may mean power, or Tonal quality from the speaker.

If you key up the radio and notice the RF meter reading, then switch
this control to the other position while still transmitting, note the
reading again.

If it changes, then it's the RF power switch.

LOC/DX [Local - Distance] switch is a crude, read: rough, means to act
like the variable RF gain control in more modern CB's. Controls
sensitivity of the receiver side of the radio, helps when you are too
close to another CB'er and your radio can't desensitize itself enough
to hear the other person clearly - more like they sound "pinched up"
or no audio at all just a nice quiet carrier signal. This control
takes care of that to a point - its' not fool-proof but does the job.

Thats the plan. I wanted to keep it in the 5 watt range. Bad thing about it I was cleaning out the garage a couple of months ago and threw out a junker that had one in it.

Greetings!

Jumper final to constant DC. 13.8V -I use output side of RF choke T1 -
voltage drop across it doesn't affect performance and provides some
filtering of RF leakage from getting back to parts of the radio that
are more sensitive to RF. T1 output side goes to branch trace to pin 1
of IC6-TDA7222p and R193.

Change resistors R124/R126 and adjust recovery time of ALC/AMC by
changing R127 to 3.3K.

Change tonal response by removing C102.

All of the above can be done without having to clip the limiter and
works well with the stock mike.

The last one, and I'll have to wait until more people try this, is to
change C190 to another larger value [between 470pF to 560pF] and some
people are questioning that one so it'll have to wait.

I like the results I get...but then I'm not everybody...

Source record: 13750

Greetings!

Good points...

Since it's been mentioned, I'll add my two cents...

With audio drive from the Driver/Final pair now just down to the Driver, you may want to mess around with the Driver section to improve it's performance when it's the only section being driven by audio.

Some Uniden radios - have no capacitance or use a 100pF on the 2166 Driver base/emitter-ground to dampen 2-nd harmonics produced. Lowering the value to a 47pF or 33pF affects output and increases drive. Also increases TVI - thats why it's so heavily damped to lessen drive from that stage.

The Final, either a 1969 or a 2312, uses an L/C in series with each other, along with heavy capacitance, to 390pF as it's sourced to ground for impedance purposes. Adding another cap, of 33pF of 47pF variety, or changing the source ground reference cap of 390, to a 420pF, takes into consideration the change in output impedance the Final now works under.

When you change the Final voltage to steady state DC, this stage can be tweaked to act like a Modulator as you'd find in a low-drive single stage linear amp - without having to suffer the problems from using such current munchers. Audio is also improved to a point but artifacts, or RFI problems - need to be filtered out so a change is needed in *both* stages.

While Dancing with the Mouse on Sun, 5 Dec 1999 15:04:41 -0600, the Modem interrupted with an MNI from ""Tempola Music Rolls" <tempola@i1.net>", and the MotherBoard buffered this to Video RAM:

:+> ah-yes....super mods.
:+>
:+> They are helpful under certain situations if they work correctly. if a "mod
:+> kit" will allow the radio to dead key two watts or so, and swing maximum
:+> power, it's working correctly.Many are pure sham.
:+>
:+> lets look at why they work at all.
:+>
:+> AM radios that drive a transistor amps, sound cleaner, and run cooler when
:+> driven in this manner., You can merely turn down the radio, but loose allot
:+> of swing that should be available to drive the amp.
:+>
:+> Super Mod's DO NOT give you "super mega power" not extra wattage that I am

:+> aware of. Tricking out the regulator circuit on exports usually reduces
:+> modulation even though you do see "extra peak wattage" on your wattmeter,
:+>
:+> The reason that "mods" seem to work at all is simple, the audio modulation
:+> circuit only puts out a limited amount of milliwatts to the transmit stage.
:+> That is why in any radio, the less it dead keys, the louder the audio will
:+> be.
:+>
:+> when you ask for more wattage from a radio, more AUDIO output is required
:+> to drive the transmitter at the same level. I'm not talking about power
:+> mics, I am talking about the audio output stage that injects the audio into
:+> the RF transmit (driver) stage, It's easy to get more RF power from a radio
:+> than the modulation circuit can handle. Tricking out the regulator in
:+> exports will easily surpass the drive requirements of the audio circuit. It
:+> "looks good" but is actually not as loud.
:+>
:+> So, if the peak power is increased, the audio output circuit should be
:+> increased as well, and this is not easy. I have experimented with a export
:+> radio, with the audio circuit disabled, using a 5 watt equalizer to drive
:+> the transmitter. this worked very well, but is not very practical.
:+>
:+> It's the balance of audio input and the amount of RF power that determines
:+> modulation. Both must be within balance.
:+>
:+> my 2 cents.
:+> Hillbilly
:+> Missouri
:+>

> E mail me; I don't get here often.
> Ken

Handhelds at CB freqs just won't do much.I run a rural mailroute in MT
and I'm always out of the cellular area.CB worked OK for a few years but
I was running illegal power and freqs and got caught by the FCC.Legal CB
was OK until the skip came in,then it was easy to talk to Japan but
impossible to get a few miles away.
Finally I got my amateur license and even in MT its hard to get away
from the linked repeater systems on 2 meters,some have
autopatch(telephone)capability and the calls are FREE!Handhelds work
pretty good for this.
I also like radio as a hobby so I put a
10,12,15,17,20,30,40,80,160(also will do CB in an emergency)meter HF rig
in the vehicle I drive on the route.I've worked over a hondred countries
while delivering the mail.
For emergency use you can't beat ham.

306. Titan 201 and Eagle Spitfire the same?

It doesn't make much of a difference or non at all,depending on why
your worried about it and what you are trying to do???
VF does vary by manufacturer and some make several models of RG58
etc.Call or e=mail the manufacturer if this is really important(phasing
harness).

It's a RF amp? They want the HAMS to
maintain their elite status.

Truckers started using altered ham
linear to boost their rf output
over the interference and static
of the cb band. 4 watts gets
swallowed at a pretty short
range.

The FCC can fine you for using low-wattage
too if you happen to accidently skip your
signal too far. They can prolly fine you
for causing radio interference with a
blender if they wanted to. They mostly
just follow up on complaints from neighbors
when they hear you thru their tv speaker.
I wouldn't use one on a base station unless
you live out in the boonies.

The receive amp brings in EVERYTHING stronger. The level it brings
the signal to can be enough to overload the front end circuits of
your receiver. When this happens, AM stations can bleed on your
CB. You can also hear images of stuff above and below the CB band.

> Dennis in Ga. 30263

I don't think the FCC has spent any money looking for people with
illegal amps,linear or not.All bands have power level limits for a
number of reasons.If a few people use many times more than the others on
a band then it makes the band useless for the people operating
legally,although you probably don't care.
Since CB amps aren't regulated many are very "dirty".

Your not making sense,CB and 11 meters are the same thing,no mods
required.The other portions of 11 are allocated to other services.

What should it cover in International mode? Is the list of modes on the following page complete?
http://members.tripod.com/~Malzev/cb-radio/george_.htm
The most George will cover is 240ch (I assume this is the International mode) according to this page, but it doesn't say what the frequency ranges are.

Thanks.

334. ANTENNA SPECIALISTS goes BYE BYE !

Newsgroup: rec.radio.cb
Date: 1999-12-05 00:00:00 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <384b194e@news.planetc.com>
Source record: 13783

Here is some REAL CB news. Antenna Specialists, formerly of Cleveland, Ohio and more recently in Solon, Ohio has moved. NE Ohio use to be the antenna capital of the world. But in a Deut. 28 land, they moved to Texas and/or Mexico, and like Hustler and all other companies, WHEN they move, the quality goes DOWN. Every time a company (factory) moves, the quality goes down. That includes companies that move from country to country. The quality goes worse & worse. That's WHY you shouldn't buy Cobra CB's or anything made in CHINA.
This AS news may be a few months or more old, but it is a real shame. I worked there in '77 for a while. Dave

Greetings folks..

Llyod, you forgot to show us a picture of your truck with 57 antennas sticking out of it. It's amazing that you still have enough room for rotating beacons on the roof and a magnetic BARF sign for the door. I suppose you've got a uniform too? LOL ! I'm sorry.. folks this is just amazing what's happening to our society these days..

It *does* make me wonder what he's going to do after January 1st with this Web site. If there was *ever* a piece of code that I hoped wasn't Y2K compliant - this now takes the cake.

Cheers,
Gary

The mere fact that he's mentioning the word "Nazi" on "his" Web page:

"For the record, I am not a Nazi, a neo-Nazi, a racist or an anti-Semite..."

shows there was some concern at one time if not now - at least in his mind.

HAMS have too many rules to abide by. It would
get pretty boring without all the speed-jive and coon-asses
you get on CB. No speed-trap alerts on the HAM freqs either.
Bucking the FCC and getting away with it gives you a feeling
that you've done something meaningful. Do you realize how
many commerical truckers operate hi-power radios? There is
no way that the FCC can regain control of CB. They should
cap the wattage at a more reasonable limit or just deregulate
it completely. Tell me how a shortwave tranciever is
practical when it's operated at a puny 4 watts? Ad a measily
50 watts and you have a radio that you can actually communicate
with. Ad the fact that the band sits in a DX window and
there you go. It makes the FCC look as tho they can't
do their jobs tho doesn't it? They're just a licensing agency. No
license is required for CB. End of story. Deregulate.

Radio's:
- GrantXL (mobile)
- Cobra 2000GTL (base)

Mic's:
- all stock mics (these units don't need power mics)

Antenna's:
- Mobile
- PowerStik
- Mobile 55
- Stargun (forgot what model)
- 2Watt
- Dr. Crow
depends on what I feel like running
- Base
- Homemade 5/8's wave w/ HM GPK
- Homemade 8-element Stacked beam (flat)
- Homemade 5-element beam (verticle)

Amplifier:
- None as of lately. Too many HAMs around town. Waiting for Extra
Class ticket to use Dentron MLA2500 on 10 meter.

Coax:
- RG-213/U and RG-214/U's eventually stepping up to 1 inch HELIAX

Accessories:
- Bird 43 (RMS watts)
- PDC600 (SWR and MOD only)
- Vectronics LP-30 Low Pass Filter
- Galaxy GL-350 Frequency Counter
- MFJ Coaxial Switch
- ELENCO 35 mhz Ocilloscope

Try looking for the BLACKSTONE or MUSCLEMAN boxes. Hard to come by but really is one to be had.

Otherwise, DAVEMADE, X-FORCE, SKULLCRAKA, and PIRATE are some of the brands to look into. I've heard good and bad reviews of the FOXIE, AT&T, GOOSERIDER and SUNNY boxes but these might be warranted as a look-see for your DXing needs. Properly tuned, and matched throughout your system and you'll never go wrong. My 2 pennies and a bag-o-chips...

I personaly do not get excited at the fact that I am "bucking the FCC" I do not feel like I am doing something meaningful when I break the rules, I personally wish the guys who freeband would either freeband in a QRP fassion and stay closer to channel 40, or do it below channel one, I know I will get flamed for this, but the majority of the hams could give a rats ass about what a cber does or how much power a cber runs, but when you start interfering with their QSO they tend to get a little aggrevated, The 10 meter band is wide open right now and the closer you get to the freq that those guys are operating on, the more prone you are to bleed on them. blah blah you get the point. Any way that is what I think about it whether it matters or not, I think more people should have a concious about what they are doing, Tim I know what you think and this in no way was dirrected at anybody in perticular.

I could E-mail you on what I have seen in the past, But their is so much more it than the amp, if you cannot feed the amplifier with the voltage it needs to do the "Rated" output than you would think that every amp you tried sucked. This is where the majority of the Techs or box builders get their bad name and reputations, all because someone did not have the right setup to achieve the possible. I personally have good and bad opinions of the amps out there, but choose not to share them in public as I personally believe that it is shared daily on the newsgroup and why would I want to voice on something that Is meaningless anyway. each person will tell you something different, it all depends on what they run or who they live closest to, most of the guys running battle boxes will say good things about their Techs as to stay on good terms with them so it is in the air when you ask for suggestions. I would be willing to bet that there has been a lot of people who viewed this post of yours and chose not to make a statement as to who makes the best 32 pill, as I have done as well...Silence is golden...

Your radio tech might be able to add a tuned network before and
after the rcv amp. This will cut down or eliminate the other junk
coming in from outside the cb band.
He may even find that your rcv preamp is oscillating and this
would/could cause other signals to be mixed with your incoming rcv.
Hard to tell from here how to fix it but your problem is not
isolated at all. Others have complained about the same thing before.

> for this application?thanx alot and 73's

Since I can't see how you wired it I can only give limited info.
You will need a single pole double throw relay.
What you'll need to do is wire the roger beep to key the
external relay and not the rig itself.
Remove the keying and rcv wires from the mic socket and attach
them to the relay so when the relay is relaxed(unkeyed) the one for
rcv is grounded and when the relay is energized the tx line will go
to ground. Depending on the brd you might have to reverse this as I
can't remember if the roger beep holds the relay keyed on rcv and
lets it go on tx.
Next you'll add a wire from the tx pin of the mic socket to the
roger beep brd where it says PTT or tx input. What this does is
allow your mic to key the roger beep brd which then keys the relay
and when you let go of the mic the rgr beep brd continues to hold
the tx on for the length of time it needs to run through the tones.
The audio output of the rgr beep needs to go to the top of the
mic gain control. This is the side of the control that goes directly
to the radio mic circuit. You'll probably need to add a resistor
between the rgr beep and this control to bring the beep level down
to a comfortable level. You may have a audio output control on the
rgr beep brd so the resistor may not be needed.
Good luck, BobC.

Please read all of this post.

1. I have a WORKING Realistic TRC-458 which is a 40 channel CB base AM/SSB radio that I am selling for a freind. The radio is some scratches and a bit dirty, (belonged to a smoker). Has NEVER had any extra channels put in it.
Great radio, as it can do over 200 channels. Info on the net. It has the 858 chip.
Full service manual included (a $ 25.00 value) and a new separate 858 chip.
Sell 1 and 2 for $ 75.00 plus shipping.
Picture avaliable for the TRC-458 ! ! !

2. A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

no mics

Please reply to email as I do not often get to this newsgroup. He wants to get this stuff sold ASAP, so please reply ASAP. I will reply to you Monday to Friday only.

Thank-you,
Greg

I wouldn't go with either, they don't seem to be too well made.
Personally I own a Cherokee CM-10 (about US$80 from Bill's 2 Way)
with expanded frequencies and love it. It is very small and does
the job right. But be aware that if you intend to transmit over
a wide range of freqs and bands you must tune your antenna for
proper SWR. I have never really TX'd from my Cherokee outside of
the CB band.

thats one mans opinion and i respect it but its not the only way of seeing things. i look at the dx as fun and exciting. never know where youll be able to talk to or hear next. why not try for your dxcc or iotas on 11meters? it has been done many many times and will continue. for the guys that dont like dx 2 meters is a perfect place to be.

Good luck and best regards from Tim 082.

But what a difference a few KHz makes.

The 10 meter ham band is not a competition between stations trying
to step on each other. For local work, there's no need to be louder
than the next guy. (Heck, you're grateful to just hook up with the
next guy)

When the band is open, rip-roaring DX is typically accomplished with
average barefoot transceiver power, or much less. The reason is that
most hams have tried this experiment: during QSO with DX station,
both drop power to a few watts. They find very little difference in
signal strength as a result.

Most hams don't see the need for or want the expense, extra hassle,
TVI issues, and higher electric bills that a linear amp brings.

Granted, these fact pertain to the majority of the ham population who
are not contesters (a few weekends a year) or dedicated outlaw CBers
(who happen to hold a ham license).

Also, requiring one to identify themselves to the federal government
and pass a basic qualifying exam in exchange for amateur radio
privileges is not "elitist". Last time I checked, the amateur license was
open to all, regardless of ethnic background, political and religious view,
age, sex, or economic status.

371. mobile antenna position alternatives

Newsgroup: rec.radio.cb
Date: 1999-12-06 00:00:00 UTC
From: nothing@nowhere.com
Message-ID: <8E94695E8nothingnowherecom@207.126.101.97>
Source record: 13811

I've got a cd antenna mounting question for you all. I'm currently debating between two possible cb antenna mounting positions, and I just need some help deciding between the two. I've got a 48" fiberglass antenna. (Wilson 1000) I'm a newbie to the cb/radio world, so I apologize in advance for my ignorance on the subject.

I don't want to drill any holes in my pickup (Toyota Tacoma), so that limits my mounting position choices. There are two possibilities that I can think of for my truck that would seem to be good. Could anyone tell me the pro's and con's of the two mounting positions listed below?

1) Magnet mount on top of the cab. I guess a benefit here would be the flat ground plane, correct? Radio Shack has a big magnet mount kit that accepts standard antenna screw thread, and advertises that it will hold up to a 48" fiberglass whip. I'd just have to remember to remove the thing when I park in the city.

2) I've figured out a way to mount the antenna to a corner of the truck bed. Toyota Tacomas have small, metal tie-down brackets screwed into each corner of the bed. I can make a custom metal bracket which would bolt in place of one of those brackets, which would more permanently hold the antenna right there in the corner. I figure a rear corner would be best. (Away from the cab.) This has the benefit of providing a good ground to the pickup. (Is that important? Seems like a magnet mount would not have that ground, since there's a big magnet and a bunch of paint between the antenna and the truck body..) The only problems are that it's about 2 feet lower than where the magnet mount would be, and it doesn't have the ground plane.

Any ideas? (Please email if you can.)
Thanks!

373. Re: what I think abt "Super-Mods.

Newsgroup: rec.radio.cb
Date: 1999-12-06 00:00:00 UTC
From: Hank Aaron <REMOVEjeffherrings@CUThotmail.com>
Message-ID: <82h18h$oc2$1@nntp9.atl.mindspring.net>
Source record: 13813

I was trying to keep it at a more simple level, but:

C= Capacitance in farads
L= Inductance in henrys
Q= Charge in coulombs
V= Potential in volts
R= Resistance in ohms
E = EMF (Electro Motive Force) in (V)olts
P = Power in watts
I = Current in amperes
X= reactance in ohms
pi= 3.1415~

Now for simple formula's (theorems/laws):

I = E / R
E= I*R
R=E / I

For two resistors/capacitors (replace R with C) in Parallel:

Rt = (R1 * R2) / (R1 + R2)

Resistors/Capacitors (replace R with C) in series:

Rt = R1 + R2 + R3 +....

Q=C*V

W= ((V^2)*C) / 2

I = E / X, E = I*X, X=E / I

Then from there you get a little more advanced. I would suggest a good book
on Electronics, RF Circuits, and Propagation. Then you'll get to go on to
read about Chebyshev High/Low Pass Filters, Nonlinear and active networks,
PLL's, VCO's,Colpitts Oscillators, DDS, Chokes, NPN, PNP, Bi-Polar
transistors, etc, etc, etc, etc.....

%<snip>%

My friend just leased a pickup with the "no holes" clause. He mounted a
pipe flange to the frame, installed an elbow and came up even with the
top of the cab between the bed and cab. He screwed on another flange
and mounted his antenna there. He loves it.

%<snip>%

Part of the problem in my area is that although the State Patrol has an
excellent base station it is manned, er, peopled, sporadically.
I can always be heard by the mobiles but many times I cannot hear them.
The only recourse is to call the 911 operator if it is a real
life-threatening emergency. We don't pass on drunk driver reports.

I just discovered a really easy way to make money while you work or
play on your computer. As long as you are connected to the Internet,
you will get paid for every hour you use this new program that can be
downloaded absolutely FREE. Seems too good to be true? Let me explain
it to you.

TeknoSurf.com is one of the oldest and largest Internet marketing firms
and they recently created a product that everyone can benefit from. The
GetPaid4 Bar is a small bar displaying ads at the bottom or top of your
computer screen. Since advertisers want you to view these ads, they pay
TeknoSurf to reach you via The GetPaid4 Bar and then TeknoSurf will
share its advertising revenues with you.

So all you have to do is download The Getpaid4 Bar and start making
money. You can even refer your friends, family and co-workers and you
will receive a percentage of their profits in addition to your own
earnings!!!

What are you waiting for? GO TO http://www.getpaid4.com/?zaarenoc AND
SIGN UP NOW!!

> reception only comes in strong when i hold the antenna. it is very
> weak otherwise. what is my problem??

You have a bad ground. Make sure the radio itself has a good ground
even if you have to run a separate wire from its chassis to the frame.
What type of antenna do you have? If it is not magnetic, try to run an
extra ground for it also.

For sale cobra 2000 gtl.

25.645-28045 (no that s not a typo) freq. range, clarifer unlocked, RC channels, converted to cobra 4 pin, variable wattage. works perfect.

No speakers, (has one built in the top case) Case and front rough and ugly, but radio works great. I bough it new seven years ago. and I have been the only one in radio, so if it don't work, blame me :-) Guaranteed not DOA.

Id take $160, + shipping.

Hillbilly.

I guess that I'm just not that interested in DXing. I did it back in the late 70's, and it just got old. I'm just not interested in "long distance radio checks". I like to have conversations with people, not 2 second "wham-bam" contacts. It's unfortunate (for me at least) that the CB band is in a frequency range that is frequented by periodic skip conditions.

> it has been done many many times and will continue. for the guys that dont like dx 2
> meters is a perfect place to be.

I enjoy the conditions on 2 meters and 6 meters. It's just a shame that there isn't more "casual" types of groups on 2 meters. There are many repeater users, that just pass the time during commute times, never really saying much, except what's on their script for the day. The long term simplex users are fewer and far between. Many times, the local 2 meter frequency is dead, so I find myself on CB again, looking for someone interesting to converse with. It's a tough call for me, when 2 meters is dead, and 11 meters is at +10 over S9 skip levels.

398. FS: Tram D-201 - needs work

Newsgroup: rec.radio.cb
Date: 1999-12-06 00:00:00 UTC
From: Kevin <kpevin@mediaone.net>
Message-ID: <b2X24.136$xP3.22425@elnws01>
Source record: 13838

Hi All,

I have a clean D201 here that has been converted to 40ch PLL. The conversion looks like it was done pretty well, from what I have found out it was done at a shop in Kentucky. Radios works at times but has a few problems, clarifier acts strange, power output and AM RX comes and goes and I have no idea how the VFO is supposed to work now, it only covers about +/- 100KCs depending on what channel its on. I'm selling this for a friend who WAY overpaid for this at a local hamfest. The radio has aftermarket oak end panels which look great. There is a couple holes drilles in the front panel by the speaker that have chrome plugs in them. The D-104 is also included. The owner said he put a new relay in it but that didnt help the AM RX from cutting out. Would make a good parts radio or a nice winter project - the radio looks great and when it does work the TX and RX works great as well.

Anyhow, I havent heard from a person who was supposed to pick it up this weekend so its up for sale again. The owner just wants to get rid of it and doesnt have internet access.

140.00 or close to it, PICK UP ONLY in the Chicago area. Reply by e-mail please.

73,
Kevin

No brainer here.

Mount the antenna as high and clear of obstructions as possible.
You won't lose a thing if you go with the magmount.

I have two linears for sale. Both are New-in-the-box, bought new in
1996 and never used.
Both are "high drive" units designed for 15-25 watts SSB drive.
Prices (including shipping):

Texas Star 350 HD-V: $175.00 obo
Boomer Deluxe 250: 110.00 obo
Both: 250.00

Please e-mail me if you're interested.
Thank You.
Darren Ream

Note: Theses linears are NOT legal for CB use in the U.S.. Purchasers
are responsible for complying with any applicable local laws.

<<<ZIP406 <zip406@aol.com> wrote in message
news:19991205173440.08486.00000605@ng-fh1.aol.com...
> Looking for good 32 pill any suggestions<<<

Before asking that question ask your self a few questions. Some of this may be redundant after reading some of the other post so bare with.

1. Do you have the means to feed this amp enough current, Including driver. Do you have the Alternators,cabling,batteries,regulators,external rectifiers, etc.? There a hefty cost included in order to run a 32 pill right.
2. What is the purpose for this amp?skip talk, shoot out.? A.M.,S.S.B (yes believe it or not, there are guys out there running 16 pills on S.S.B.)
3. What do you exspect to see out of a amp? watts, clean sound?
Which brings us to the next question?
4. do you want class C, OR AB?
5. what's your budget?
6. do you want a box that's is cosmetically clean, heavy duty internal parts, surplus parts, new parts? All this has to do the with price.

YOU USUALLY GET WHAT YOU PAYS FOR. There were allot of boxes mentioned on this list and allot are priced differently. Some of the cheaper boxes are good and work fine but are cheaper because the builders cut corners to bring the cost down. Some of the more expensive boxes are priced like that because they went through the extent of tuning the box so that it is efficient as it can be. This doesn't mean it has any more parts or better parts, it just mean they spent the additional hours tuning it right. (well maybe not hours, I am talking about myself here)

More questions?
1. Is it a printed circuit board with silver coat or a copper clad etch with a router?
2. are the power cable welding cable or nice stereo type cables?
3. are the component beefy? Are the resistors heavy duty? are the caps mica or metal? are they using 2" transformers on the outputs? Good quality relays? Is the heat sink big enough to dissipate the heat properly? Does it include fans? Force air cooled?
4. last and not least, warranty, tech availability? parts and labor warranty?Does the tech live in your area or across the U.S.? Is the tech always busy or bombarded with repairs?

Not to discourage you but you are making a expensive purchase and these are a few things to consider. *Now obviously if your not a tech most of this wont concern you*. If your on the west coast you might want to consider Skull Cracka. He uses very good quality parts like big transformers,relays, powder coated boxes. strain relief fittings, etc. Also his prices are good.

This says allot to me when you see craftsmanship in a box, quality parts and the price is low. Now how well he tunes them and they do on the air I cant really say, I have never used one. Oops I lied, I have used a 4-pill and it worked fine for the price and being a class C box. I haven't seen his boxes recently so I cant really say if there still built the same way. I will hightlight three biggest factors I would make in deciding, not to say you should.

1. Price & quality(these go hand in hand)
2. tech location. (This will help for installation and repairs).
3. warranty (parts &labor) This usually does not include pills.

I hope some of this info helps you in your decision.

good luck.
KRS

Right on, Boo !!!! I have seen both good and bad boxes come from some builders. The main difference is consistency from model to model and each unit that comes down the line. Out of all of the various units that i have seen, i definitely have favorites. They are NOT of one specific brand either.

As it is, a 32 pill requires a TON of power supply. This means at least 800 amps of ALTERNATOR. Keep in mind that this is just for the 32 pill BY ITSELF !!! If you can't give it this much, forget about ever seeing full output out of it or having it run consistently.

Depending on the efficiency of the specific box that you would want to run, you would also need a very solid driver / pre - driver and radio. Between these things and being able to run the vehicle effectively, you'll probably need about another 150 - 200 amps of alternator. You should figure out how your going to get a real 1000 amps of alternator onto your vehicle. Then think about regulators and batteries.

If you can't afford to set it all up accordingly, you should probably think about a much smaller box. Be reasonable and deal with reality in terms of what you can really afford and run on a regular basis. This will probably get you much better performance than a big box that is improperly installed. Sean

>
-=PEAKABOO=- wrote in message <82fhfpslo1@nntp9.atl.mindspring.net>...
I could E-mail you on what I have seen in the past, But their is so much more it than the amp, if you cannot feed the amplifier with the voltage it needs to do the "Rated" output than you would think that every amp you tried sucked. This is where the majority of the Techs or box builders get their bad name and reputations, all because someone did not have the right setup to achieve the possible. I personally have good and bad opinions of the amps out there, but choose not to share them in public as I personally believe that it is shared daily on the newsgroup and why would I want to voice on something that Is meaningless anyway. each person will tell you something different, it all depends on what they run or who they live closest to, most of the guys running battle boxes will say good things about their Techs as to stay on good terms with them so it is in the air when you ask for suggestions. I would be willing to bet that there has been a lot of people who viewed this post of yours and chose not to make a statement as to who makes the best 32 pill, as I have done as well...Silence is golden...

All I can say is....
In Prime Minister's CD about us Superbowler's he says and I agree....

A WOMAN LOVES A MAN WITH A GREAT BIG OLD JOHNSON!!!!!!!

As you guys already know the guys with Big Johnson's were recorded on that CD..
Of course ICECOLD is on the CD!!!!

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN........

The FCC has spent TONS of money trying to stop the manufacturing of these amps. Many manufacturers were pulled into court about 2 - 3 years ago and several received fines. Sean
>

AB7RS wrote in message <384B02A8.9A4@imt.net>...

I don't think the FCC has spent any money looking for people with illegal amps,linear or not.All bands have power level limits for a number of reasons.If a few people use many times more than the others on a band then it makes the band useless for the people operating legally,although you probably don't care.
Since CB amps aren't regulated many are very "dirty".

422. Re: velocity factors

Newsgroup: rec.radio.cb

Source record: 13862

Right on, John. I have also seen some RG-58 use foam and some that used poly as the insulator. That would make a pretty noticeable difference in terms of electrical length.

Also keep in mind that most velocity factor ratings are simply that : RATINGS. I have had very few cables that actually matched the manufacturers specs. Most are ballpark, but not close enough if doing any type of precision work. You would really need to do testing to find the individual cables real VF. Sean
>

John J. Gervasi wrote in message <384B08B8.5A748500@bellatlantic.net>...
The only thing I would add is that VF also matters if you are trying to get a
true SWR reading. To test the SWR seen from the antenna feed point as reflected back into the transmitter, a true reading is given if you use a 1/2
wavelength of coax at the test point. But the 1/2 wavelength is dependent on the VF, so the length of coax will differ based on the type of coax.

There is an excellent article on this subject in the December issue of Popular Communications Magazine (pg. 4). Written by the editor, it describes the slow downfall of REACT, gives suggestions for reviving REACT, and offers suggestions for people who want to help others on the radio without REACT. While I really don't agree with his solutions for reviving REACT, it is a solid article on the present state of emergency communications in the Citizens Band.

As for REACT itself, I think they should get rid of the whole team/club concept and center their efforts around individuals who want to monitor the radio for emergencies. Many people today are not comfortable working with groups of people. It is nearly impossible to get a group to agree on anything, and many of the leaders of these groups are too concerned with self-glory and not concerned enough with emergency communications.

By centering on individuals, REACT could better cover areas of the country where there are not enough people to make up an effective team, and it eliminates the negative aspects of group/club membership (which I think is the main cause for people leaving REACT).

Of course, REACT seems determined not to do this (for whatever reason), so I agree with the Pop Comm Editor - REACT's days as an organization are limited.

Jeffmc3518 wrote:
>
> who gave ANYONE the authority to tell ANYONE
> what to do / not do with their private
> property?

Jeff, a person is absolutely free to do absolutely anything with his private property (radio) as long as it does not affect anyone outside of his private property. The person can use the radio as a paper weight, play football with it in the backyard, or use it for a hood ornament on his car.

But, as soon as that person starts transmitting, that person is no longer confining his activities to his private property - radio waves do not stop at his property line. At that point, society, through its elected government, has a right to have some say how that person uses the radio frequencies that belong to the society as a whole.

Our society, called the United States of America, elected a Congress to pass laws for the common good (not an individual's good alone - the common good). And that Congress created the Federal Communications Commission to make the rules affecting radio.

Now, if somebody does not like the way Congress works, he is free to change Congress. If a person does not like the FCC's control of radio, he is free to talk to his member of Congress. If a person does not like the rules that the FCC has created, that person can talk to the FCC. All of that is a person's right as a member of this society.

However, I can tell you right now that there is no way the FCC is going to expand the frequencies for CB, or increase the power allowed for CB, or increase the range that CB'ers are legally allowed to make contacts, or anything else. Why? BECAUSE IT DOES NOT SERVE THE COMMON GOOD.

Yes, all of these might benefit some CB'ers. But, for every CB'er shouting for increased power, there is another person complaining about interference from CB radios using increased power. For every CB'er demanding increased frequencies, there is another person complaining about the incroachment of CB'ers into their assigned frequencies. And for every CB'er shouting for increased range, there is another Cb'er complaining about the interference by people breaking the existing rules.

When Amateur Radio is added as an existing option that can meet all of the demands for increased range, power, and frequencies, there is absolutely no reason for the FCC to even consider a change in the existing rules. Now some may not like Amateur Radio as an option, but

it is an option that serves the common good (even if it does not serve the good of the few individuals who don't like it). Therefore, it is the only option that a CB'er, unhappy with the existing Citizens Band, is likely to get under the current climate towards CB'ers.

> i don't hear anyone screaming about
> broadcast tv putting out more and more
> graphic sex, language and violence.

And, since you brought it up, if you don't like what is on television, complain to the FCC. That is your right as a member of this society. But bad behavior by a others in this society does not give anybody else the right to behave badly, nor does it minimize anyone else's bad behavior (in other words, bad behavior on television does not justify bad behavior on the radio).

No, he doesn't work for Motorola, and no, you don't have to lose anything to
get general coverage.

Sorry if all your experiments where with a Sangean receiver. Those who are
interested in general coverage, and spent more than a quarter of the welfare
check have found that a real receiver costs nearly a thousand dollars, and
performs quite nicely.

I will put the old Collins R-390 against anything that you have today.

>
> You mentioned Uniden. I was thinking specifically about the RCI-2950/2970,
etc.

are
> H-O-T!

Yes, they are...

H-O-T enough to pick up a lot of shit other than the signal that you are
trying to get!

I see better rejection, sensitivity and tonal quality out of my Kenwood 440
than I do out of ANY 11 meter rig I have... And I do have a couple... Both
tube and solid state.

The Kenwood kills the Galaxy (RCI) hands down.

I suggest that you get a non-butchered ham rig and do the comparison.

Jeff,
This is not a performance radio. So to compare it is not a fair thing to do. You are comparing apples to oranges. This is a radio for the not to interested in CB user. It works fine, but is limited in the receive,as it can be very choppy if you back the squelch down.

It is great for small spaces and will provide you with the road information needed on a travel expedition. But it is not a skip shooting, go getem, hopped up cb radio that a lot here are looking for.

But if you are looking for a radio for road trips only get a good antenna, have it tuned to your vehicle and get the 75wxst. Its cute, its functionable and it will suit your needs in this case.

A uniden Pro510xl is a good small radio for performance. These opininons are mine and not neccessarily shared by those who post on this new group. No offense intended.
God Bless and happy Holidays.

If you want to see some good redneck humor, check out this site called Dr. Verne's Northern White Trash Etiquette. It's got a column this week on a woman who needs cooking tips on how to catch herself a white trash man. Pretty funny. There's also this thing about Bubba Claus, Santa's cousin, taking over the Christmas toy delivery.

It's at http://homestead.com/drverne

The key phrase is "built properly". How many so called "cb amps" do you
think are "built properly"? Dave made? Don't even try. Even the
relatively clean and stable Texas Star, can't hold a candle to the
amateur grade solid state mobile amps, as far as filtering, proper
biasing, and overall clean operation. Of course you'll pay at least $600
for a mobile 1 KW peak amp. But as they say, you get what you pay for.

Or better yet, make sure that the SWR of the antenna is 1.1:1 then the
standing waves reflected back into the coax become insignificant, and
the length of the coax becomes unimportant. Only when there are standing
waves does the length of the coax matter.

I agree. Skip does nothing but reduce the enjoyment of the locals trying to socialize over the air. Once you've worked a few skip stations, it becomes boring. Been there, done that.

Unfortunately, all that you can do is to pray for a swift end to this sunspot cycle. Then the band will return to a state of blissful quiet, with the locals once again able to talk without needing 100 watts or more of power, or having to run the squelch up at S9 levels.

Sean,

What are you talking about? Nothing you are saying is incorrect - it's
all understood and agreed it's correct. In fact, check back a few weeks
ago - I think you will find I said the same thing.

However, you didn't read very closely - the fellow here says
">That is to say; while the vehicle is
> moving or it is moved close to large metal objects, the antenna
> impedance seen at the transmitter end of the coax changes."

This statement is totally correct...this statement is not:

">Certain lengths of coax will keep these changes to a minimum assuming
> that the antennas on the roof are 50 ohm"

No coax length is going to prevent the *antennas* feedpoint impedance
from changing when a metallic object comes in close proximity with
an antenna - period. The "mutual impedance" (the antennas self impedance
and the effect of surrounding elements) cannot be controlled by
coax length.

The ghost of Bob.

There were similar radios to the Titan such as the Cherokee ah-100 but they were stuck in "10kC CB-type" channel steps. The Titan tunes in 1kc increments (ie...28.305-306-307 ect). The Eagle you mention may possible be a 10kC version unless stated otherwise in their descriptions. For picture/specs of the Titans:

The only thing I would add is that VF also matters if you are trying to get a true SWR reading. To test the SWR seen from the antenna feed point as reflected back into the transmitter, a true reading is given if you use a 1/2 wavelength of coax at the test point. But the 1/2 wavelength is dependent on the VF, so the length of coax will differ based on the type of coax.

I think you are all missing the point. Personally I would rather see a tougher technical exam and maintain the reserve of current bands that are now designated as CW only. But make the ability to use CW optional for the exams. Look, if you can't communicate using code -- I have tried to learn it many times and have failed to discern 4 tone characters -- then use one of the other modes available but don't deny me the right to certain frequencies for phone because I can't use CW on other frequencies! If this approach is used, you will get better qualified operators due to the tougher technical exam and still have those who want to use code able to do so. What's more, you will increase the number of operators thus breathing new life into Amateur Radio.

Just a thought,

John

Definitely agreed, been there done that. I never paid for a Rat Shack radio but I have had a few through trades and even the TRC465 that I got NIB turned out to be a piece of junk. I would never accept one even as part of a trade of many items, they are worthless to me.

>
>KRS

I doubt that you will find many military rigs with AM coverage on HF. They shifted to SSB decades ago.

The King of military AM rigs was the ART-13. It covered a frequency span from below the broadcast band (with an adapter) to 18 MHz. It was plate modulated and put out a rock-crushing signal from the 813 final, with 811-a modulators! I believe they were last built in the late 40s or early 50s, although re-manufactured units were available as late as 1970 in the surplus markets.

One source you might try is Fair Radio Sales in Lima, Ohio. If there is an AM military rig, they probably have it.

*is now the coax, and the antenna radiator - both are together as one
*unit.
*
*This is what I've been talking about.
****

It still does not correct the problem.

You do not correct SWR probelms by adjusting coax length. All you do is trick the transmitter into seeing the impedance it wants. If that is what you wish to do then that, it is okay by me. Besides any antenna can have a matching network that will transform it's impedance to that of the transmission line. It is not done by conjugate matching either. Conjugate match works great for amplifiers. When the complex conjugate is presented to the transmitter it is not a matched condition. Matched conditions on transmission lines are only when the load and the source are the same as the characteristic impedance of the transmission line.

I read your web page on coax and came to the conclusion that you have so over simplified transmission lines or you flat do not know what you are talking about. I was in a mode to correct the errors in it that I flat stopped. It will be better to rewrite it than correct it.

For a licnesed amatuer, I would have expected you would have used at least the ARRL Antenna Handbook as a reference. It is simple in many ways but better than what you have on your web page.

>
>John

John, I have to totally agree with you here. I am a newly licensed Ham after about 17 years of toying with the idea. I have been a CBer since about 1973/1974. I do have the technical knowledge and the ability to learn more. I have absolutely no desire to use CW, but have no problem with those who do. Your ability to pound a key or not is not a sign of how good a Ham you can be. Proper education in the Hobby and a warm welcome are what is needed. I am currently a Tech, but I plan on doing my 5wpm to upgrade to the HF frequencies because I HAVE to.

It would seem that for those Hams who are worried about the CBers coming over and ruining it for them need to open their eyes. I went to a hamfest last month and it is half the size it was only two years ago. There was also a Computer show at the same Fairgrounds that was packed all day with a constant line to get tickets.

Computers are doing more to take away from Ham Radio than CBers are doing to "ruin" Ham Radio. Maybe if CBers were met with more enthusiasim, they would feel a desire to join and/or upgrade and improve their knowledge. With computers at the forefront of so many things, including communicating around the world, maybe CBers can be a saving grace for Ham Radio. Just like the bad Hams are not the norm, not all CBers are bad either.

Just my .02 worth.

Hello all,

I am interested in finding out about rigs that have all of the controls and the display in the mic (I have a space-limited application).

It looks like the best option might be the Cobra 75 WX ST, but I'm certainly open for suggestions.

I have a couple of specific questions:

Are the finals and the receiver rf circuits actually in the remote box, or is the box just a sort of a junction box that passes the signals to the handset?

Also, am I sacrificing much in performance if I go this route? Cobra has always had a great reputation, but is this type of radio too much of a compromise, even for them?

Thanks in advance.

-Jeff

487. Re: Petition Filed With FCC

>However, I see you STILL didn't answer the question posed to you.
>
>
don't feel bad. they never answered my question either.
so as to not start a fight this time, i'll ask mine in a generic sense:
who gave ANYONE the authority to tell ANYONE what to do / not do with their
private property?
there may be those who say that we spoil cb with higher power, extra channels,
noise toys or whatever but i don't hear anyone screaming about broadcast tv
putting out more and more graphic sex, language and violence. the FCC doesn't
seem to have a handle on them either. it would seem to me that all of this
effort would be better spent trying to clean up this segment of the radio
spectrum that reaches a larger portion of the population and a greater portion
of that population who is at greater at risk for damage, (our youth).
it seems funny that their are more things that can be said and shown on free
broadcast tv than you are allowed to say or show on cb, ham or sstv.
the owners of broadcast tv don't even have to apply for a license in their own
name and the engineer doesn't even carry any risk for broadcasting any of it.
if we break a few rules, there is a generic segment of the radio community that
crawls up our collective asses for it. how does broadcast tv get away with it?
go figure???
jeff

This was sent to me from a CB Pal.... Enjoy and keep up the good spirit!!!!

T'was the night before Christmas, when all through the land, no skip was rolling, not even ducks stirring on side band. The D-104's were polished and hung with great care. In hopes that "skip'' would soon be there. Ducks were nestled all snug in there shacks, while some were still hiding under their rigs. All with visions of becoming a superstars dancing through their heads.............. When all of a sudden, out in DX Land, there was much clatter. I sprang from my recliner to see what was the matterI ran . I ran over to my Grant, turned up the volume and turned the rotator too. There was "skip" rising and I found it to be surprising. So, I sat down and decided to listen a spell. And, I could tell that some of the heavy weights had been sprung from jail.

From the Magnolia, Bayou, Big Horn, Sandpile, Buckeye, Land of Lincoln, Blue Grass, the East Coast, West Coast, the Mighty Blue and the Mini Grass, too. The Super Star voices rang out with a roar. Good Friend, Mean Pill, Carpet Bagger, 766, Captain Boss, Golden Arms, Wild Greek, The Last Word, Prime Minister, Number 13, and many many more. Some of the biggest and best "P Pickers" that have ever spiked a D-104.

Sam in the Dome, Ten Speed, Earplugger, IceCold, Carpet Man, Black Diamond and Ghetto Shorty, too.
What a wonderful sound that was made. All the "big boy" with the "hammer down" making such a joyous noise and having fun playing with their toys. Then, all at once the "skip" was done, it had been fun and everyone had won. Yes, it was the Night Before Christmas on 27.025 MHz and the "mud ducks" got some, too.

End

Happy Holidays to each of you and your families. I hope this will be a memorable holiday season. To each, I do wish the best and continued good health and wealth in the year 2000. May God continue to shed his grace on each of our places.

Yours Truly,
Twenty Eight Trey, A.K.A. TipToe

Its funny that you bring this up. I have some locals here running some of the nicest sounding rigs, Eagles,Yeasu,Trams. All running with a minimum of a KW to talk across the street. Ive got a neibor that runs a home brew Raytheon with pair of 3-500z local!!! All they do is bitch, moan and cry about each other all night long. It doesn't bother me none because they don't come out till the skip is gone, they hate skip. I guess they cant figure me out just like I cant figure them out, different worlds I guess.

Ice Cold very true, I remember back in the mid 70's when CB was big the sunspot cycle really hurt the hobby the people who really were into it stayed and waited it out but lots of others dumped the hobby when skip ran rampant all day. I remember back a few years when the cycle was at a low when you got good dx conditions and couldnt wait to hear some skip again that month. Now its like give me a break with this .

GMRS is on the same freqs., go get a GMRS RADIO! Save your self the

trouble. GMRS needs a licienses, some of your local GMRS types are worse than your baddest ham nightmare. Used by small businesses and people like your friendly tow truck and taxi drivers.

Doug,
I believe what you are looking for is "QuickFix 3.0". Also, version 4.0 is due out soon. I do not own the program, so I cannot tell you about it. It looks pretty neat, though. Go here>>>http://www.efjdevices.com/efjdev.htm

Hope this helps....

How did you do the channel mod? I have a grant with an expo kid style
mod, switching the crystal for 40 channels above and below the regular
band. But this leaves a gap where the A channels would normally be
encountered, and I thought you couldn't get more than 15 channels (or
so) below ch.1 with only pll mods. Is this some combination of the
two?
This is mostly just curiosity, I don't think I'd do the mod if I had
it (I have enough channels to get away from most noise), but I
certainly would like to learn it and file it away for later.
Thanks
Ben

Well Paul? I had a TS MOD V driver and it bled my neighbor like crazy and he's a couple of houses down the block from me. Because of the bleedover (and being that he was a HAM too) I decided to go legal. No power and modified station. The mobile radio is a little past tweeked but being that the guy I was bleeding on was a HAM (and if I was bleeding his phones, TV and stereo's, I was probably bleeding my next door neighbors as well) I decided to keep the station as low key as possible.

"Too many HAM's around town"... this is a true statment. Out here in these parts around the desert, the DXing is prime for HAMs. I can drive a mile in radius around my house and find close to 15 Amateur Operators (the last time I counted). There's a lot of retired folks around here who are HAMs judging by the 40+ foot towers and TRI-Band beams. And being in the desert, there are no hussle and bussel of the big cities, no skyscrapers, no re-barb for that fact to create non-optimum conditions for radio. The population is probably 25,000 (don't quote me on this). So, the probable ratio of Amateurs is very high.

The HAMs in this town are alright folks. Sometimes they come down to AM CB to see whats going on. Yes, we do have problem children but the HAMs leave it up to us to monitor and enforce the "Good Neighbor" unwritten law of running huge amounts of power and profanity. Actually, the HAMs here get a kick out of us as they listen while we "regulate". Most times the troublemakers go away for a while (which is nice). The alliance between us CB folk and HAMs are ok for now, I guess.

So all that in a nutshell (a little long-winded though) is why I try not to use any amplifiers off the station. Its better to stay in the "black" than to risk heavy penalties. Don't get me wrong though. I dig hearing alot of "BIG RADIOS" on skip as I sandbag but not yet for me. Better to keep the neighbor smiling than to see them snarl at me. 2 pennies and a dollar bill...

137... back out!

```
For sale DAK mark IX Radiotelephone
Just back from the radio DR.
All works fine
Will do 8 watts on a Bird meter
Excellent audio reports
$375.00
Visa or MasterCard
Buyer pays shipping
Pictures available at
```

I can't speak for the CD ROM, but I would recommend Lou Franklin's books. They are the bibles of the do-it-yourself CB mechanic. If you read his books, and understand them, you'll be up to speed in a hurry. If you rely on one of the "cut this/jumper that/tweak this/replace this" books you'll still be just as fantastically ignorant afterwards and probably end up with a whipped CB radio. :->

527. Re: Cobra 148 Swing mod!

Newsgroup: rec.radio.cb
Date: 1999-12-07 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <384c4e4a.239180@news.iserv.net>
Source record: 13976

Greetings!

Cobra 148's and Grant XL chassis types don't use "Audio Transformers" like their AM-only Counterparts. T1 is an RF choke to keep put RF and engine/power supply noise from the Audio chip [IC6] power supply line and smooth out ripple and wine while powering the finals - thats why it's so large, it's got a lot more current on it than the MB3756 regulator IC chip.

You might be getting this confused with the method of using a "Modulation Transformer" to generate the proper drive and impedance to work into the collectors of the Final and Driver in an AM only radio.

The 148/Grant AM audio output of the audio chip is driven into a power amp designed to act like a switch, and a linear amplifier at the same time while in AM mode.

When SSB is enabled, no audio power goes to the AM regulator, instead it's turned on like a switch and supplys full voltage to the Driver/Final.

This part is the AM regulator - and is used for CB radios with AM/SSB together. Works similar in function as a Modulation Transformer, but provides DC power, and Audio Amplification - as well as bias to drive the Driver and Final all while in the AM mode.

This is one of the failings of SSB type chassis like the 148 and Grant styles.

The AM only radios use a Modulation Transformer that can develop higher voltages without having current regulation. It can flat out-do an SSB radio in modulation and swing drive. Merely by using the Transformer in a fashion to supply current for heavy drive, and the voltage rise to help the collectors of the Final and Driver provide the boost needed to make AM-only radios so stellar in performance if properly "soop-ed up" right.

In an SSB radio, to keep things stable, they use regulation, both voltage and current are controlled to keep things tame...which limits modulation to a point, but the joy of having one of these radios is to combine more power into an audio Sideband, that the AM radios cannot do.

SSB radios use low-level modulation when in SSB mode. The term "low-level" is because of where it starts at. It's at the pre-driver mixer stage of the RF TX amp section, where carrier and Audio are mixed together and the carrier is filtered out, leaving audio - to be

amplified in the subsequent stages. And is why in SSB mode, the Driver and Final get steady DC, with no audio - it's not needed nor is it desired, it's already been mixed to the right frequency and anything added to it causes problems.

I hope this helps explain why T1 is not the Audio Transformer - it's an RF choke designed to filter the power supply to the Audio Amp and Final/Driver.

So, if you're really looking for SWING, an AM/SSB radio is not the ticket to stardom. Use an older AM-only radio for the best results.

While Dancing with the Mouse on 06 Dec 1999 06:12:43 GMT, the Modem interrupted with an MNI from "justin535@aol.com (Justin)", and the MotherBoard buffered this to Video RAM:

****
Most ham rigs have output stages very similatr to CB radios. Ham rigs with
autotuners are an extra circuitry added. Generally in the form of a "L-
Network". That is a series inductor with a shunt capacitor. The broadband PA
stages of most newer ham rigs are less tolerent to SWR changes than older tube
rigs. The PI-network of most tube PA's are more forgiving and can match a wider
range of impedances presented to it. Solid state broadband PA are designed to be
near 50 OHm and do not provide for much variation from that.

The antenna does not have to be resonant. It need only be matched to the
characteristic impedance of the feedline. The matching network is at the antenna
and not the radio or in between. In that case there is no reflected wave.

case in point. take 150 feet of chain length fence. There can be a matching
network that will present 50 Ohms to any 50 Ohm coax. I seriously doubt that 150
feet of chain length fence is resonant. But there will be no standing waves.

wrote:

*The only thing I would add is that VF also matters if you are trying to get a
*true SWR reading. To test the SWR seen from the antenna feed point as
*reflected back into the transmitter, a true reading is given if you use a 1/2
*wavelength of coax at the test point. But the 1/2 wavelength is dependent
*on the VF, so the length of coax will differ based on the type of coax.
****

Velocity factor is critical when using coax as lumped constants. It one were to
use a chunk of coax as a capacitor or and inductor then VF is extremely
important. If you are trying make the reflection coefficient of the transmitter
zero then it will only help to start the coax trimming process.

For F1/F2 layer propagation falls off remarkably with the sunspots. E layer propagation actual picks up more in the minimum years than in the peak years. E layer propagation though occurs year round and is less dependant on sun spots. Much of the skip on CB is E layer propagation. E layer can exist in single and multiple hops thus giving some remarkable long distances.

Andy, good retort on the "swingin'" 148. I'll have to do some experimentation one rainy day. But, I'm so satisfied with the performance of my rig that I'm tempted to leave well enough alone. If I had 5 cents for everyone that told me I sound "choice" I'd surely have enough to buy a brand new Yugo.

> This is one of the failings of SSB type chassis like the 148 and Grant
> styles.

Amen. I use mine on SSB about 98% of the time. And that is maybe why I get my knickers in a twist over people using theirs for *only* AM. Seems like a waste.

> The AM only radios use a Modulation Transformer that can develop

> properly "soop-ed up" right.

At the risk of sounding like a man of contradictions, for shear personal amusement I have no qualms bastardizing AM only rigs. One time someone recommended the Radio Shack TRC-413. I did some experimentation and must say that this radio can sing and dance. I believe the audio power amplifier is good for about 7W so you can well imagine what happens when you apply all of that to a 4W carrier. I like modulation transformers and firmly believe the hysterisis in the transformer gives them a unique tone. Some radios, like some of the old Citizen AMers, use a tapped-winding, or autotransformer for the output modulator. Different approach but similar results. I like the tone on the old Sears and Citizen microphones. These were the devils with the rounded front and they sound really tinny. Love that sound!

Pretty much agree with the spirit of your post except one thing,
which I believe you have somehow gotten very misinformed about.

If I had a chirp in my CW note (or RF in my audio, or even some
QSB on my signal) I'd certainly WANT the other guy to tell me,
even if I knew. In fact, the last numeral in the traditional
cw RST report is used to describe the tone of the CW note. You
wouldn't send "599" to describe a chirpy signal, would you?

I've had chirp on my CW signal a few times when running BA
type rigs. In each case, I got helpful advice, not scorn.

I don't believe any CW op feels better when they hear a chirp
on the other guy's signal. There's no "elevation" involved, just
a simple exchange of technical information that helps us to
run our stations better.

>
>I will put the old Collins R-390 against anything that you have today.
>

I have a lot of respect for the R-390. For four years, I ran a communications center with 12 of these boat anchors, operating around the clock under adverse conditions. Very stable, great selectivity, etc.

But I very much prefer the modern Amateur gear. Sideband sounds much better on the new rigs, and there is something to be said for "flat" cw filters vs those with a peak--although I put the "ringing" signal to good use when being jammed.

I stand by my original post: The R-390 and the Motorola HF SSB are great for specific frequencies, but they are not so handy for searching out random contacts.

As for general coverage, I stand by my original comments on that subject, also. From radio magazines in the 30s, 40s, 50s and 60s, to the latest Amateur manufacturers......single band rigs still enjoy popularity because they can be optimized over a narrow portion of the spectrum.

Source record: 14007

Here are some observations that i have made.

The RK 56B is more consistent in tonal qualities and noise canceling characteristics from mic to mic.

The 636 is more ruggedly constructed, making use of a better cord and switch.

Which one you choose is more a matter of personal taste and practicality.

Factory coax is typically low grade and VERY poorly installed. The excess cable in the truck is typically wound into a large choke, drastically altering the performance of the system. PL-259's are also very low grade and have a tendency to pull off the cable after a while.

Hope this helps. Sean
>

Both work well, but are personal preferences.
Michael G. Heitczman wrote in message

I was just wondering what some peoples opinions were as far as what they think sounds better as a microphone in a truck ..... a RK-56B or Astatic 636L.....

....also does anyone have opinions on factory coax that comes installed in trucks

i'd appreciate some e-mail if anyone has time......Mike234@ix.netcom.com

Thanks !!!

I like the RK-56B, and as for as the coax, I don't like the motorola plugs they
use to make the connections.

Uh.... No. I refuse to buy into that pseudo yuppie appliance. I have no justifiable need (nor do many other people) to be on the phone while I'm in the car, or standing anywhere else.

If you have a job (like sales) where your business depends on your availability and reachability, that's one thing. Personal use, is strictly a status thing. Plus it has been linked to brain tumors as well. No thanks! I'll stick to RADIOS!

I don't consider it a "failing". It's just a more convienient way of
making modulation.

>
> The AM only radios use a Modulation Transformer that can develop

> properly "soop-ed up" right.

High level modulation transformer radios can only "make more modulation"
if there is sufficient audio drive wattage available. If you've only got
a 4 watt audio amp chip, then you're not going to be able to drive more
than an 8 watt carrier to 100% modulation, unless you remove the
modulation from the final stage and trick up the driver and pre drive
stages.

A better way to think about the difference in modulation schemes is that
transformer coupled radios ADD power through modulation. Regulator
radios regulate modulation from the supply line. If you short out the
regulator in AM mode, you'll get a heavy carrier, of about 18 - 25 watts
depending on the radio. That will be your PEAK modulation number as well
(minus the .6V transitor drop) when the regulator is working. With that

in mind, you should never set the carrier level above 1.4 of the peak
power level, if you want to maintain 100% peak modulation

>
> SSB radios use low-level modulation when in SSB mode. The term

> desired, it's already been mixed to the right frequency and anything
> added to it causes problems.

Careful! "low level" modulation usually refers to AM audio applied to a
low level, pre drive section. In SSB, modulation is more accurately
applied in the balanced modulator. Yes, it is technically "low level",
but it also removes the carrier, which differs from what happens in AM
low level schemes.

Well if cb's are useless for emergencies then you need to use a cell phone or
some kind of phone and dial 911.
As for me my job has purchased a pager and 2 nextel phones for me since being
in the computer business they need to contact me regularly if there is a
problem with the database. The only reason I got 2 phones was because I somehow
convinced the boss it would be cheaper and my wife needs a phone too!!!

Well I dont know were your from but if you dont have to compete with locals that are in the same watt class as you or higher, then a 16 pill will probably suffice. Like guys in L.A. , Its seems like theirs a big station around every corner that you have to compete with. If your in a location were you have allot of guys keying up with you at the same time trying to catch the same skip as you it gets ruff, but if your in a area were your pretty much to your self then when condition in your area rolls in, all you need is a 8 pill doin 1500 or so and you can talk all day long.

Now if your lookin to shoot out, throw every thing I just said out the window!

bye,

Source record: 14031

Michael,

The Road King 56 and the Astatic 636 microphones are
identical in that:

they both use the same mic. cartridge

they both use the same ptt switch

they both take advantage of capacitive audio bandpass coupling

there is only ONE difference! the 56 uses a 5:1 step up

transformer and the 636 does not! This is why the output

level from the 56 is twice the output level of the 636!

Jack

Hi All:

I have For Sale the Dyn Speech Processor Printed Circuit Board, with
Original construction, installation, parts list, and operation plans for the
Speech Processor. This board mounts inside you radio, NO Batteries needed.
Asking only $12.15, shipped.

For other CB related items...Radio's, Portable's/Mobile/Base, Photofax,
manuals, and tune-ups, please visit the following page:
http://home.att.net/~j.dow-kb2tlb/home.html/mypage.html

Took this unit in trade. Model SPU-416-KT, 438 -470 Mhz 16 channel programmable. The radio has three channels programmed, one repeater and two simplex. 4 watt output, scan, and PL. Radio, antenna, and battery only, no charger. Seems to be in good working condition and at least a 7/10 cosmetically.

I'm not really familiar with the Uniden line and the radio was identified by my description on line. Will sell for best offer or trade. Looking for SSB CB (40 ch only - no converted 23's) or amateur radio equipment.

FAQ:
No, I can't reprogram the radio, but I'll give you the e-mail address of someone that can.
Yes, it will cover 440 ham band.
Yes, it will cover GRMS channels,
Yes, it COULD be used as a 4 watt radio on FRS.(not legal or advisable)

Please e-mail offers or questions. Thanks

Jim, W8EMS/9

Aw now come on. Just think of the day when you have to have a cell phone.
Don't you even want to know how to work it:)

Just funnin.

If you think you will get brain tumors with a cell phone, just think of what
all that RF is doing to your body when you sit in your little tiny truck
talking skip, with, well you get the picture.

Whew! I think this may be a cause for another government study. What do you
think.

Happy CB land.

>> Thanks !!!

In reference to the exact same switch used in the rk56 vs 636l.

The switch in the RK56b will undoubtedly fail within the first year of use. This is the new one. The switch is manufactured by the same company that makes the 636l switch with one distictive difference. The spring in the rk56 spring is internal. The spring on the 636l is outside the working machanism. I have found the the switch in the astatic mic will last longer and is fixable by the average large fingered do it yourself person and a retractable ball point pen.

We usually use the 636l switches to change the rk56b switch when it breaks.

The tone on the rk56 can be a bit more on the tinny side where the 636l is a little bassier. The tin sound will help you cut through a little better.

The mic switch is opposite of each other.

The rk56 is a popular mic, therefor it may be the mic of choice in your area.

If you want rugged, durable and noise canx look at the BUM1. Also a mic Astatic puts out. Big Ugly Mic 1. That is the one I prefer. It does not cut my modulation out like the RK56 does. Therefore I can use this mic with ease and I don't have to shout. That's my flaw not a mic flaw. Good for the soft spoken person.

So there is my 2 cents worth. Its really what you prefer. There are slight differences in price too. Well maybe more than slight depends on where you purchase it.

I think that they are two very different mics when compared and tested. Take your radio in to the shop and ask them to let you hear the difference between the two on your radio. I do that for my customers when they ask.

Good luck and God Bless.
Happy Holidays.

Message-ID: <82k321mcs1@autumn.news.rcn.net>
Source record: 14054

Flip the radio upside down with the front panel facing you and remove the bottom cover being careful not to pull on the speaker wire, which you should dis-connect at that point. Near the front panel of the radio you will see a small circuit board that is elevated from the main board and is mounted inverted with its circuit traces facing upward. Remove the soldered tab that is connected to the chassis and serves as a ground, making sure that no solder drips or splats onto the main board below, then remove the phillips screw that holds the board in place and remove the board. Look on the component side of the board for a series of three small holes labled Con1, if the radio has solder filling hole one, remove it, and solder holes two and three together. It is very easy to confuse the holes because of the layout so be careful.

The modification is very easy, and what Eagle basicly did was to remove the three pins that pins two and three were shorted out on with a plastic jumper block as you would see on 2950 etc... and leave three empty holes there that you short out holes two and three with solder.

Thats it...the unmarked top center button is your band select, and you will have 10 bands of 40 channels. The LCR button serves as a -5 or +5 kc up or down adjustment. The other buttons function as marked. Do not crank up your AM power & SSB power!! Leave them as stock because this unit has no heat sinks and runs hot!!! Even with a 1.1 SWR it runs hot, so leave it at 4 watts AM, 12 watts or a little under SSB, or you will burn it up!!!! Leave your modulation limiter in place and crank your modulation pot fully clockwise. Run the microphone gain on maximum if using the stock mic, and hold the mic about 8 inches from your mouth and you will get out loud enough and clean enough that people will find it hard to believe that you do not have a power mic. Alot of features for the money!! So Long.

From: Matthew <mudpup@execpc.com>
Message-ID: <384D9114.1BD4@execpc.com>
Source record: 14059

I am in the process of putting together my Maco 5/8 and I noticed that they have it designed (or at least this is what I thought the instructions said) that the bottom section is held on by a hose clamp not one of those clamps like the other sections. If this is right, is that sturdy enough or should I make something better?

Thanks in advance

Mudpuppy

I wouldn't go above a strong 16 pill with two alternators.

Figure an alternator per 8 pills, and then you need to run your driver off another electric system.

Makes you want to suggest that people go get themselves their power supply sorted then go match the amp to the supply!

>>>That is how the smart ones end up anyway!

100A per Kw will get you into the ball-park for average not peak current drain.

>>>I figure one alternator per 8 to 10 transistors.... Then run your driver off something else, and NEVER run a driver section inside the pumphouse. One stage per box, please!

My neighbor just informed me that he could hear my conversation on the CB on his TV, phone, and stereo. He said it didn't break up his picture but he could hear every word I said. Would it help if I turn back the mod a little, raise the antenna, or buy a good filter. Since the picture wasn't disturbed on his tv I didn't know if the filter would help. I was thinking that the mod was below 38 Mhz anway so it would still come through. He's being pretty cool about it now but I don't know how long this will last. Some of you experts must have encountered this same problem and I would appreciate your advise ASAP.

Thanks a million!!!!

> But,thou would not have a mouse in your hand

Wrong.

Commodore had the mouse WAY before the Mac people in CuperWierdo ever thought of it.

As a matter of fact, the MAC O/S is a clone of Broderbund softwares GEOS (Graphic Environment Operating System), that was first offered for sale for the Commodore 64.

> and thou would still have the zerox machine on the shoulder for your GUI Clone

Nah.. We where modifying those WAY long ago with a TV on the screen for a cheap and easy BW Laser Printer!

>
> This world and it's contents are brought to you by Apple

But, they where designed on a clone!

This subject has come up time and time again, so with out being redundant on the subject I suggest you spend $18.00 and pick up this book at www.rfparts.com Its call RADIO FREQUENCY INTERFERENCE "How to finf it and fix it." Its a wealth of information and you can go through it methodically and tackle each problem.

How To Shower Like A Man
1. Take off clothes while sitting on the edge of the bed and leave them in a pile on the floor.
2. Walk naked to the bathroom. If you see your girlfriend/wife along the way, flash her making the "woo-woo" sound.
3. Look at your manly physique in the mirror and suck in your gut to see if you have pecs (no). Admire the size of your dick in the mirror, scratch your balls and smell your fingers for one last whiff.
4. Get in the shower.
5. Don't bother to look for a washcloth. (you don't use one).
6. Wash your face.
7. Wash your armpits.
8. Crack up at how loud your fart sounds in the shower.
9. Wash your privates and surrounding area.
10. Wash your ass, leaving hair on the soap bar.
11. Shampoo your hair (do not use conditioner).
12. Make a shampoo Mohawk.
13. Pull back shower curtain and look at yourself in the mirror.
14. Pee (in the shower).
15. Rinse off and get out of the shower. Fail to notice water on the floor because you left the curtain hang out of the tub the whole time.
16. Partial dry off.
17. Look at yourself in the mirror, flex muscles. Admire dick size.
18. Leave shower curtain open and wet bath mat on the floor.
19. Leave bathroom and fan light on.
20. Return to the bedroom with towel around your waist. If you pass your girlfriend/wife, pull off the towel, grab your dick, go "Yeah baby" and thrust your pelvis at her.
21. Throw wet towel on the bed. Take 2 minutes to get dressed. >>

Well it looks like i've been thrown in the trick bag this time! My radio has no board mounted on the side like you described, i knew something was wrong when i opened the radio up to mod it.

A friend of mine bought a Comanche Black Hawk. (same radio) and his is the same way no board, there must be a new mod for these radios or they can't be modified.
CB

DEFINATELY get a low-pass filter for YOUR radio! And turning down the modulation a little would eliminate some splatter. You can always buy HIM a HI-PASS filter from radio Shack.

C.B 'etiquette' went out-the-window about 10-15 years ago. It USED to be very fun, and almost 'professional.' There were numerous CB clubs that held meetings, and they even gave away equipment! But I guess times have changed. Additionally, CB was EXCELLENT in the mid '70's. But I WON'T hold on to the past. Now it is PURE chaos. Enjoy...

Well, the computer has not lowered my radio use that much. Of course, I have nearly the perfect setup.

My radio equipment sits less than a foot away from my PowerBook (within easy reach). And I have the microphones for both radios (CB and Ham) mounted on a boom arm that reaches me while sitting comfortably at my computer. And I have foot switches to key both radios sitting under my desk.

With this setup, I can type on my computer, and talk on the radio, without having to move an inch. If I'm really busy on the computer, I can ignore the radio. If I'm really busy on the radio, I can ignore the computer (or doodle on the computer while talking on the radio).

In the case of ham radio, the computer is an important part of the system. I use it for packet and use a computer program to translate many of the digital modes heard on the radio.

Comuputers do not have to take over your life - there is still time for other things, especially if you make the computer fit your lifestyle instead of your lifestyle changing to fit the computer.

I'd be a little careful making a statement like that, John. The FCC has been working its way down the radio frequencies over the last couple of years. First it went after the cellular companies. Then it hit the television broadcasters. Last year it went after the VHF/UHF bands. Now Hollingsworth is talking about increased enforcement in the 10-meter ham band.

If the pattern stays constant, we can expect the freebanders to be next. And then the CB band.

They may not have enough money to go after everyone at once, but they can target a specific segment, and a specific few individuals within that segment, to make an example out of.

:+> > In an SSB radio, to keep things stable, they use regulation, both
:+> > voltage and current are controlled to keep things tame...which
:+> > combine more power into an audio Sideband, that the AM radios
:+> cannot
:+> > do.
:+> ....How is the voltage and/or current regulated in a SSB rig?
:+> ....Why can't an AM rig have hi power in its sidebands? Isn't
:+> that what you're doing when you increase the modulation?

The way I understand how this AM versus SSB function is handled,

The main drawback is for the Low-level modulation component to be properly amplified, the AM regulator needs to reduce power to offer some "headroom" so that you just don't hear carrier. Since SSB radios in the AM mode mostly produce carrier with some low frequency sub-audible tones [read faintly modulated form of carrier], that are filtered out in the front end, but are injected or bypassed, along with audio, into the AM regulator thru the use of the Mod amp section which handles carrier power ratio to audio level from a tap that goes to the balanced modulator from the final stage of the mic amp section.

Actually, all the audio delivered is thru the use of the mic-amp section to directly drive the AM regulator/Mod amp section whether AM or SSB - what? Read on...

The Mod amp section [glancing at schematic for PB-122 board] is the PNP transistor that uses the AM regulator output -a PNP like 2SA1012, and provides the regulation and audio envelope control.

The circuit driving this is like a follower design. When audio is applied, the NPN [usually a 2SC945] device conducts audio and this is inverted to the actual signal. So it's like the transistors' output is inverted and is placed against the base drive on the AM Mod Amp. This amplification can't occur if the Mod Amp can't be driven linearly. It'll act like a switch everytime you apply audio to it, this is how much gain and control this section has.

Thats where the AM power control comes in.

A DC bias is applied to the base on the NPN transistor, turning it on but in it's linear operating range. It's a small voltage. It's to allow DC and audio mixing to occur.

When audio and DC are applied together, the output varies within a given range - from steady DC, to DC + Audio component. This is then applied to the Mod AMP [that big "black box" in the back] and this is how the audio envelope is produced. With low-level carrier being mixed in at the driver.

Because of this design, you have little, if any, overhead to work with within the given level of performance and operating range these two transistors work in. Too much DC bias applied to the NPN, then the transistor conducts more inverted bias to the Mod AMP - and less audio can be passed thru this mixing stage. This in turn, is why less audio is heard when you drive carrier [AM power] too far. The DC bias level of the AM power output, and audio drive at the base, of the NPN follower - the audio level has to exceed the DC bias level for small signal amplification. The result is, you lose audio but gain carrier.

And is why AM regulator only allows a given level of carrier - set by the AM power section, and the DC bias present at the NPN follower - so AM power is less, with audio forced to drive linearly into the Mod AMP. This is why we have the Diode to provide a forward voltage drop to keep Bias from complete shutoff/cutoff and acts like a limiter to keep the Mod AMP forward biased all the time...

In SSB, this section is biased off, and the Mod AMP acts like a simple switch, where the low-level modulation generated by the balanced modulator section, can do it's magic and generate SSB due to lack of carrier [filtered out at the Audio IF crystal, and DC from AM power removed] and audio IF mixed in with PLL-IF to make the RF with hardly any DC offset [except for bias present at the base from the steady DC - usually set to 70mA at the most for bias drive to make it work like a class AB at the base of the Driver and Final].

Want to know some fun stuff? Check this out. Using SSB properly driven, the NPN/PNP pair is not really shut off, only the AM power DC bias to it is...then when you "re-apply" AF modulation to the SSB envelope, you gain more power from the type of drive this produces - the Mod AMP (the PNP) transistor can apply audio even when driven to the point of a switch, due to the bias level present and you can tinker with the SSB on/off transistor switch bias and resistance to

change that...you can have a lot of fun with this...

To find out what I'm talking about, take a Modulation Meter, set it for dead carrier AM for that SSB radio, then switch over to SSB.

Then mess around with the ALC control, as you open all the way, the Mod portion of the meter goes flat when you yell and scream into the mike - why? Because the ALC limiter is not working the Mod Limiter section on the Mic amp section of the radio and in turn, that little NPN transistor [it's saturated fully on] - it no longer has control and if you turn down the ALC control, and watch a Power meter, you'll find the Mod returns, the best setting it to have Mod meter read at max, and at the highest spot of RF power to gain the most benefit from using this ALC control as you yammer and yell into the mike...fun eh?

[Kids' don't tell your parents to whistle into the mike while doing this...]

:+>
:+> > SSB radios use low-level modulation when in SSB mode. The term
:+> > "low-level" is because of where it starts at. It's at the
:+> pre-driver
:+> > mixer stage of the RF TX amp section, where carrier and Audio are
:+> > mixed together and the carrier is filtered out, leaving audio - to
:+> be
:+> > amplified in the subsequent stages.
:+>
:+> .....And all this time I thought it was done in the balanced
:+> modulator section.

...[...now I know you're teasing me ;-)... I have radios that have this scheme to produce AM audio and SSB using a Diode Balanced Bridge network]...

The filtering network, the way it's set up, only allows you to slide the carrier IF because the balanced modulator is still producing audio, both sides - but it's being filtered out to provide a steady DC bias to the Audio IF section that is re-mixed at the RF pre-driver section, as - you guessed it - steady carrier...Thats why there are so many of 'em little coils - one to control PLL IF for VCO control and Audio IF straight from the Modulator and thru the crystal filter(s) and why Carrier Balance control is so important.

Carrier Balance? AM Power? Well, I'm not trying to derail the whole mess, but the Balanced modulator can't do much on AM - only low-level and low-frequency - envelope control. The tonal and main envelope drive is set by the NPN/PNP AM regulator section using DC bias for linear operation for Audio with a DC component applied while in AM.

[If you offset the carrier balance in AM, you'll find yourself with a very crude form of Phase modulation - like FM with AM. So don't do this on your pride and joy HiPo miracle of a radio - you'll sound, as well as hear, a lot of noise from people yelling at you...]

The typical AM portion of the radio [read:AM regulated CB AM/SSB radios] in AM mode - act much like their Modulation Transformer counterparts, but are directly driven by the Mod AMP transistor into the respective Collectors of the Driver and Final pair.

Now, if you want to talk about Balanced Bridge Diode networks, I'm all ears! I've got a TS-3010 using this scheme...

Neat but a bear!

Regards!

Trucks that have "factory" coax, check the designation.

For AM/FM antennas, they use RG-59 75 ohm stuff...

If it's RG-58 or similar - should be suitable for CB - but I'd
seriously inquire with the dealer first...

It's not the coax thats the main problem...it's the type of
connections and the quality used - that can make or break the system.

697. Ignition noise, Dodge Caravan 99

Newsgroup: rec.radio.cb
Date: 1999-12-08 00:00:00 UTC
From: ddufault_ve2bap <ddufault@dsuper.net>
Message-ID: <82m8v0$j2t$1@nnrp1.deja.com>

Ignition noise, Dodge Caravan 99

Here is my English translation of my previous posting "Bruit d'allumage - Ignition noise"• Please excuse my bad English. My interference problem is in the same category that the one of Carl Salomon W5SU, with slight differences.

I've got a problem with a '99 Chrysler Dodge Caravan whereby a bunch of trashy noise gets into the receiver portion of my 2-way HF-VHF-UHF amateur radio transceiver, an Icom IC-706 (receives from 100 KHz to 450 MHz). This problem ranges up to the UHF band, giving a reading of S5 on the S-meter at 440 MHz. Its intensity varies with the RPM of the engine on the S-meter reading. When demodulating in AM (this mode is available on all frequencies covered by the radio), I hear a trashy noise whose frequency changes with the RPM. My vehicle is brand new: 10 000 Km (6000 miles)•

The noise ranges from pulse-type ignition noise, to trashy (computer-generated?) junk. The noise has to be radiated (picked up by an antenna) and I'm not getting it from the power leads...I've eliminated that possibility by temporarily wiring the radio to a marine battery, and the noise is still there when the engine runs. It only goes away when I disconnect the antenna. The magnet-mount VHF-UHF antenna is installed on the roof at the rear of the vehicle.

I tried some other receivers. The original Chrysler radio is also much affected; I hear the RPM-changing noise on AM and I lose reception of weak FM stations with engine running. The cassette portion is NOT affected, confirming a radiated noise. My scanner receiver (connected on a 117 V AC external source) receives noise up to 1200 MHz (S-1 reading)! This trash obliterates any signals weaker than that, on each radio I tried.

I disconnected the alternator; the problem is still present. It seems it's not the fuel pump either; I tried to turn the ignition key to the RUN position, without starting the engine. No noise was generated. I built a small magnetic loop antenna (a coaxial cable looped on itself, the inner conductor connected on the shield, over a 3 inches diameter loop), connected it on the Icom receiver over a long (20') RG-58U coaxial cable, and used it to probe around the car. This revealed that the noise source is obviously the ignition system; I got a radical increase of noise with the loop placed near the cap distributor, the coil, the spark plugs and their cables. I receive a much smaller signal with loop near the computer, and nothing when near the fuel pump or its supply wires.

I visited my Chrysler dealer service center; they made some tests, most of those mentioned above (all of them are discussed on the newsgroups and in the ARRL Interference handbook). They checked the engine with a DRB tester: everything was OK. The vehicle is already factory equipped with resistive spark plugs and cables. The computer is built EMI-protected in factory. Engine, computer, and other critical components are well grounded through heavy braid. After consulting their engineering staff, they found nothing and have no idea of what to do now. My feeling is they are not familiar with the EMI problems, and don't really care about them.

My girlfriend had a cute suggestion: "Why don't you choose another hobby - stamp collection, for example?"&#65533; Hope I won't have to choose this solution&#65533; hi! I've done other mobile installations but haven't run into one as stubborn as this. Is this a unique problem to this vehicle? Any ideas? Thanks for any assistance.

702. Copper BUSTED by the FCC?

Newsgroup: rec.radio.cb
Date: 1999-12-08 00:00:00 UTC
From: thumper485@webtv.net
Message-ID: <10799-384E8F3E-22@storefull-217.iap.bryant.webtv.net>
Source record: 14151

I ordered a little Apache 240 from Copper two weeks ago and was told it is on back order until sometime in January. I e-mailed Massie Coppers president, and got a reply. He stated that, "the FCC is cracking down on certain models of 10 meter radios that look like a CB and the Apache 240 is one of them." He further said that, "Copper has gone back to the overseas manufacturer to make the Apache look more like a 10 meter radio." This SUCKS!! Does this mean no more cheap convertible Apaches and Sidewinders? Anyone know whats really going on? Anyone selling an Apache 240? Thanks

My method: Buy your self the 32 pill, then upgrade your system step by step.
I have two 250 amp leeces for my 32 and a separate leece for the m800
driver. This setup will do some good numbers. As I learned from this NG that
when I upgrade to more alts I will see better numbers. No problem you can
always add more alts down the road.
It makes more sense to upgrade alternators then your boxes. If you upgrade
from a 16 pill to a 32 pill what use do you get from the 16 pill?
Nothing.....

704. Re: Motorola HF SSB Radio

Newsgroup: rec.radio.cb
Date: 1999-12-08 00:00:00 UTC
From: bill <bwiese>
Message-ID: <01bf41a6$0da99f60$6c84c03f@bill_pc>
Source record: 14153

The Motorola HF rig is primarily designed for communications on a relatively few preselected frequencies. It certainly will be a fine radio, but will prob. not have the ease/freedom of spin-the-knob random tuning of a regular ham-type rig. It will prob. have excellent selectivity and sensitivity, and is most likely optimized for the mode most commonly used in ship/ long-range communications: SSB, in a channelized mode. Overall, receive & transmission qualities will prob be similar to those of the higher-end ham rigs.

Even "the best" CB rigs pale in comparison. While HF ham & commercial rigs now use complex multiloop PLL synthesizers or PLL+DDS synths to achieve low "phase noise" measurements - critical for near-noise-floor weak signal extraction in a crowded band - most every CB rig I've seen uses a cheap lil' ol' PLL chip w/small steps (i.e, 10kHz or less). A real PLL setup would have *large* steps - 100kHz or even more - for one loop and manipulate another one or more mixing loops or the other PLL's clock signal so as to get the desired finer (i.e., near continuous) frequency increment.

Multistage crystal filters? Low noise mixers? Naaah, costs too much. From what I've seen most of these CB-type rigs have cheap $1.50 ceramic filters in the 2nd IF - when there *IS* a 2nd IF. Seems that many (most??, don't know) SSB rigs run in a single-conversion mode with product detection happening as the 2nd conversion, instead of happening after the 455kHz downcoversion. Another bit of selectivity lost. Adjancent channel rejection and image rejection figures, intermod handling abilities, etc. are gonna have to be quite a bit worse on a typical CB or "10 meter" radio.

The assertion that single band rigs like CBs are better than wideband ham rigs is an apples-to-oranges comparison - don't know any such single-band rigs that have the same level of circuit design detail that a full-house HF rig has. Even the micro rigs and lower-priced entry-level and HF rigs (SGC2020, TS50s, FT100, FT840, IC707, IC-706, DX70, DX77, etc.) are gonna superior for weak signal work in crowded conditions.

But it'd be real interesting to take a variety of CB rigs and run them thru the same parametric product review lab testing that some of the regular HF gear goes thru. I suspect the numbers would not be that great. Does that mean these cheaper rigs can't pick up a weak signal? Nope - a sensitive front-end

combined with good skip conditions will certainly bring 'em in.
But when bands are crowded and filled with heterodynes, noise &
interference, etc. you do get what you pay for. Are these
cheaper rigs terrible? No, pretty good bang-for-the-buck.
But none of 'em are a Kenwood 940S either...

I think we can reasonably suspect there's more of a performance
difference between a typ. $150 - $350 CB/"10 meter" vs. a typical
entry level/micro HF ham rig than there is between these ham rigs
vs. the best full-bore, full-priced, all-the-features ham or
commercial-grade HF rigs.

Thumper,

Are you sure you want the 240? Wouldn't you rather get the Sidewinder?
The 240 doesn't even have a RF Gain control on it.

Paul

He has got enough to swing it forward, but if he runs a lot of key then it
will overload, the reason I say he has got enough, and this is said with no
disrespect, is because to get 96 pills to operate at their max possible
output would be a challenge in itself, let alone trying to find the right
amount of drive to aquire this.

The FCC over the past few months has been using a clause in their CB regulations that states " Radi equipment PRIMARILY designed for citezen's band use mst be "TYPE ACCEPTED OR FCC approved" for the CB service. They have apparently "decided" that many so-called 10M radios (the blatant ones that have the 40ch dials, echo ect) are "Primarily designed for" CB operation & therefore are non-type accepted cb equipment & therefore subject to confiscation ect...even before you move the "jumpe"r. A truckstop in Maryland recently got a warning & unmodified Galaxy 10M "CB's" taken away using this logic. The maufacturers could "disable" the XMIT & put a lightbulb on top of a Galaxy 88 & call it a fancy "Flashlite" , (untill you move the internal jumper) , but these games won't seem to fool the FCC anymore....

It already is, but then they don't enforce the gun laws on the books
either?

Then, expand the CB band to 80 or 120 channels. Giving more
> room for one of the most crowded and highly used bands around.
Good idea, lets just expand the CB Band to 28.000 with NTIA allocations,
put in NB FM, viola 150 channels easy.

As far as channels go; 35 trough 40 are usually used for SSB.
Sometimes 16 is used also (23 channel radios). A.M. and SSB
can not occupy the same channel without interfering with each
other. This channel usage plan is not mandated by the FCC. It
is just a gentlemens agreement that has been (for the most part)
used to stop unnecessary interference between the modes.

728. Jaws Mark 11 40ch AM ?

Newsgroup: rec.radio.cb
Date: 1999-12-08 00:00:00 UTC
From: phil <phil@invest.fsbusiness.co.uk>
Message-ID: <mJtXQ2ALHsT4EwlK@invest.fsbusiness.co.uk>
Source record: 14177

Is any tech familiar with this very compact 40ch AM set?

It's got an FCC approval badge on the rear and a name of Metro Communication Inc underneath.

A LC7120 pll and a 2SC2078 in the final.

Nothing to right home about but I'd like some suggestions of any tx tweaks to get a little more kick out of it?

It is my only solid state CB with a mod transformer.

Do you think I can drive a pair of 1446's with it?

These are used as drivers to 8 2879's in my much modded Pirate amp (compliments #12)

Any help appreciated.

Phil / UK

Bonjour mon ami, Chrysler has had several recall notices for excessive noise on two-way radio equipped cars. I don't know if it covers your specific model, but it would be worth looking at - call your local Chrysler dealer.

> I disconnected the alternator; the problem is still present. It seems

> with loop near the computer, and nothing when near the fuel pump or its
> supply wires.

I've never had to chase a noise problem this much, Daniel. I would suggest you find another minivan of the same year/model and do an A/B test to see if yours is excessively bad (it sure sounds like it is). I'm most suspicious of the ingnition coil(s).

> I visited my Chrysler dealer service center; they made some tests, most
> of those mentioned above (all of them are discussed on the newsgroups
> and in the ARRL Interference handbook). They checked the engine with a
> DRB tester: everything was OK. The vehicle is already factory equipped
> with resistive spark plugs and cables.

Aha! I know that in the past, typically if you are using resistor wires you should not be using resistor plugs. Conversely, if you are using resistor plugs you should not be using resistor wires. I don't know much about newer vehicles though so maybe things have changed.

735. Trade - UHF 16 Channel HT for SSB CB

Newsgroup: rec.radio.cb
Date: 1999-12-08 00:00:00 UTC
From: W8EMS@webtv.net
Message-ID: <15218-384EDE37-5@storefull-123.bryant.webtv.net>
Source record: 14184

No acceptable offers received yet. The Ht is still available.

Took this unit in trade. Model SPU-416-KT, 438 -470 Mhz 16 channel programmable. The radio has three channels programmed, one repeater and two simplex. 4 watt output, scan, and PL. Radio, antenna, and battery only, no charger. Seems to be in good working condition and at least a 7/10 cosmetically.

I'm not really familiar with the Uniden line and the radio was identified by my description on line. Will sell for best offer or trade. Looking for SSB CB (40 ch only - no converted 23's) or amateur radio equipment.

FAQ:
No, I can't reprogram the radio, but I'll give you the e-mail address of someone that can.
Yes, it will cover 440 ham band.
Yes, it will cover GRMS channels,
Yes, it COULD be used as a 4 watt radio on FRS.(not legal or advisable)
Please e-mail offers or questions. Thanks
Jim, W8EMS/9

Source record: 14189

Greetings!

After reading the post, I've come up with some ideas and questions for you to ask.

Take a look at the Distributor cap, and remove it. Look underneath, at the rotor, there should be a static shield that completely covers all the base of the distributor that houses the sensor and the electronics. It sits below the rotor, and is stationary, it also uses bolts to mount it and keep it in place that use the metal housing as the shield and return for noise.

It's wise that you remove the rotor and the static shield to verify that water has not penetrated into the housing causing rust.

It's also a good idea then - after verifying that things are clean - to then take it to the dealer and ask about service bulletins and the addition of an EMI RFI filter - on the power supply input from the battery.

Some Fords [I know, yours is a Chrysler/Dalmer] also have a tang that mates with a 1/4 spade female, that an RFI by-pass cap is connected to, the wire lead in the terminal side, and the main body bolts to a convenient spot next to the terminal. You might be missing this part.

I'm thinking that the RFI shield may have gone bad, or there is an RFI by-pass cap that either is not connected, or is missing. Check with your dealer on this.

While Dancing with the Mouse on Wed, 08 Dec 1999 18:44:49 GMT, the Modem interrupted with an MNI from "ddufault_ve2bap <ddufault@dsuper.net>", and the MotherBoard buffered this to Video RAM:

:+>
:+>
:+> Ignition noise, Dodge Caravan 99
:+>
:+> Here is my English translation of my previous posting "Bruit d'allumage
:+> - Ignition noise"&#65533; Please excuse my bad English. My interference
:+> problem is in the same category that the one of Carl Salomon W5SU, with
:+> slight differences.
:+>
:+> I've got a problem with a '99 Chrysler Dodge Caravan whereby a bunch of
:+> trashy noise gets into the receiver portion of my 2-way HF-VHF-UHF
:+> amateur radio transceiver, an Icom IC-706 (receives from 100 KHz to 450

:+> MHz). This problem ranges up to the UHF band, giving a reading of S5 on
:+> the S-meter at 440 MHz. Its intensity varies with the RPM of the engine
:+> on the S-meter reading. When demodulating in AM (this mode is available
:+> on all frequencies covered by the radio), I hear a trashy noise whose
:+> frequency changes with the RPM. My vehicle is brand new: 10 000 Km
:+> (6000 miles)&#65533;
:+>
:+> The noise ranges from pulse-type ignition noise, to trashy (computer-
:+> generated?) junk. The noise has to be radiated (picked up by an
:+> antenna) and I'm not getting it from the power leads...I've eliminated
:+> that possibility by temporarily wiring the radio to a marine battery,
:+> and the noise is still there when the engine runs. It only goes away
:+> when I disconnect the antenna. The magnet-mount VHF-UHF antenna is
:+> installed on the roof at the rear of the vehicle.
:+>
:+> I tried some other receivers. The original Chrysler radio is also much
:+> affected; I hear the RPM-changing noise on AM and I lose reception of
:+> weak FM stations with engine running. The cassette portion is NOT
:+> affected, confirming a radiated noise. My scanner receiver (connected
:+> on a 117 V AC external source) receives noise up to 1200 MHz (S-1
:+> reading)! This trash obliterates any signals weaker than that, on each
:+> radio I tried.
:+>
:+> I disconnected the alternator; the problem is still present. It seems
:+> it's not the fuel pump either; I tried to turn the ignition key to the
:+> RUN position, without starting the engine. No noise was generated. I
:+> built a small magnetic loop antenna (a coaxial cable looped on itself,
:+> the inner conductor connected on the shield, over a 3 inches diameter
:+> loop), connected it on the Icom receiver over a long (20') RG-58U
:+> coaxial cable, and used it to probe around the car. This revealed that
:+> the noise source is obviously the ignition system; I got a radical
:+> increase of noise with the loop placed near the cap distributor, the
:+> coil, the spark plugs and their cables. I receive a much smaller signal
:+> with loop near the computer, and nothing when near the fuel pump or its
:+> supply wires.
:+>
:+> I visited my Chrysler dealer service center; they made some tests, most
:+> of those mentioned above (all of them are discussed on the newsgroups
:+> and in the ARRL Interference handbook). They checked the engine with a
:+> DRB tester: everything was OK. The vehicle is already factory equipped
:+> with resistive spark plugs and cables. The computer is built EMI-
:+> protected in factory. Engine, computer, and other critical components
:+> are well grounded through heavy braid. After consulting their
:+> engineering staff, they found nothing and have no idea of what to do
:+> now. My feeling is they are not familiar with the EMI problems, and
:+> don't really care about them.
:+>
:+> My girlfriend had a cute suggestion: "Why don't you choose another
:+> hobby - stamp collection, for example?"&#65533; Hope I won't have to choose

:+> this solution&#65533; hi! I've done other mobile installations but haven't run
:+> into one as stubborn as this. Is this a unique problem to this vehicle?
:+> Any ideas? Thanks for any assistance.

I never posted here before, but I need some advise. Looking to buy a
10/11 meter radio for my truck. I believe I narrowed it down to a few
models..Since I need swing out of a radio for my 2 pill, the choices
came down to these: Virage 39(was told it swings to 50 watts)
Ranger RG-66(swings about the same) Connex 3300 HP or go back to a 77HML
Galaxy..I do not want to make a bad decision and be unhappy..Any coments
appreciated...................

Yes, he had a good time with that.

Unfortunately, I have more bandwith than his ISP, which kind of threw him
for a loop.

And the SMTP server he used (in Hong Kong) was more than willing to give me
the log files from their proxy.

Made quick work of all the BS after that.

I'll take this vote. I'm sick of the "fear of the crash". I have to deal with this stuff every day at work. People are so damn stupid I wish it would all crash just so I could watch all the powder puff's riot out of fear. I do feel sorry for all the cops come 12:01 though....

Jon.

BZZZZZZZZTTTTT !!! Wrong answers.....

>"they both use the same ptt switch"

Incorrect. As was pointed out elsewhere, the same company makes both of their switches. They are different switches though. The switch used in the Astatic is more durable and tensioning spring is field serviceable. The RK's switch is not as durable and basically becomes junk once the internal spring breaks.

>" they both take advantage of capacitive audio bandpass coupling "

The 636 does not have ANY capacitors in it. The RK 56 does. The capacitor is used to attenuate lower frequencies at a rate of appr. 6 db's per octave (removes the muddy sound), which typically makes the RK slightly sharper sounding.

>"the 56 uses a 5:1 step up transformer and the 636 does not! This is why the output level from the 56 is twice the output level of the 636!"

Due to the 636's wider frequency response, it will typically drive the radio harder and produce higher levels of modulation (and therefore greater peak power). This is especially true in radios that have wide audio bandwidth and people with deeper voices. Bass reproduction takes greater current output levels than mid or high frequency reproduction and the radios audio circuitry responds accordingly. While applying the RK's capacitor filtering design to the 636 may result in noticeably cleaner sounding audio in some cases, modulation levels (peak power output) may take a slight hit in the nose.

As someone else noted, the BUM-1 is a higher output mic than either the 636 or RK. Since greater output requires higher sensitivity, it would also be LESS noise canceling and pick up more background noise. Just for the record, i have discussed these differences with Mark (the design engineer) and Scott (the vice president) at Astatic several years ago. Sean
>

Jack Thurston wrote in message <384D3C3E.8BFE26EC@cybertrails.com>...
Michael,

The Road King 56 and the Astatic 636 microphones are
identical in that:

they both use the same mic. cartridge

they both use the same ptt switch

they both take advantage of capacitive audio bandpass coupling

there is only ONE difference! the 56 uses a 5:1 step up

transformer and the 636 does not! This is why the output

level from the 56 is twice the output level of the 636!

Jack

I don't have enough time to type in all of the gear that i own. Let's just say that i have mutliples of the following: Yaesu's, CPI's, Browning's, Tram's, Dak's, RCI's, 2510's, Cobra's, Uniden's, etc.... The same can be said about having more than a few 10 / 12 tube Phantom's, Heathkit's, Black Cat's, etc... How about watt meter's : Bird's, Coaxial Dynamics, CPI's, Diamond, Mirage, Siltronix, Black Cat's (BOY, do i have Black Cat's), etc.... How about base antenna's ??? Let's see, i have some Jo Gunn's (beams and sticks), Astro Beams, Sigma 4's, Wilson's, several Penetrator's, Turner Sky Kicker's (now that's a nice antenna), etc.....

I think you folks get the idea. Yes, i am a junkie (and a major pack rat). It's good to see that i'm not the only nut out here though. I have to say that most of you folks have got pretty good taste in radios too. I noticed more than a few people hanging onto their old 858 SSB chassis too :)

If i remember correctly, Painkiller (from Louisiana) made comment on the NG about all of the radio gear that i have at home when he came up to visit. I do remember that he specifically wanted one base tube amp that i have. Needless to say, he didn't get it. The power supply alone easily weighs over 100+ lbs and you could easily dump 1000+ PEP into it..... I have watched # 12 dump 500+ watts into amps that are half it's size.

Speaking of # 12, I have to admit though that as much as i have, it is but a drop in the bucket compared to what Dennis has. I have him beat in terms of radios and amps, but raw electronics and components..... Let's just say that RF Parts has less inventory..... Sean

There is enough current draw spared per alternator to do it with that many
alts, he runs this in comp mode. That is three 32 pills, if he ran 2 alts
per 32 pills he would be running 6 alts, which by the time you include the
drivers it is really cutting it close.

Ive got a local Ive been talking to hear on the cb. He has offered to give me a linear. However it needs the finals put in it. There are no cb shops where I am located. How much work is involved in doing it? Also if I do find someone that can do this how much would something like that cost? Hell I dont even know what he means by having the finals put in it lol.

Currently all I have is a ProStar 400 Import. It really does a god job
for the $

I used to operate a ROBYN 520 base, It was a talker but it finally gave
out and I was tired of fixing it.

I still have a President Grant with mods and no FM (does this mean it's
a US model?) It does not work, but I hope to get it fixed one day.

******

The RK-56B comes with the same lightweight
mic cable that the 636 does. As far as output,
the RK-56/B delivers almost 2x more millivolts
of audio signal to the low impedance input of
the transistor rigs on the market today. I
don't know what you are smoking over there, but
you need to give it a rest.

Source record: 14213

i feel like this why do they make linears if they know that they can be used for 11 meter band...if they didnt want them used on the 11 meter band then they would make them different so they couldnt work on 11 meters

and besides the question was. What is a linear amp. not to get into an arguement over linears. everyone has their own opinion and they are fre to thank what they want to but not every person in life is going to share the same opinion as you do.

and theres my opinion

catch ya later but until then take care of yourself and each other.

I'm glad that I'm not the only one with "the sickness" (as my wife calls
it). I do have some limits though. I don't collect any old junk, but
more of the "classic" radios that people swore by in the "good ol'
days".

I have 2 858 radios. Hopefully the audio chips stay healthy, since you
can;t get them anymore, although I have had some success retrofitting
another type of chip, and rewiring the pins. I don't know if there is a
pin for pin replacement.......

I know how to work the basics, which is all that I'd ever need. I like the idea of a cell phone for emergencies, and would have one for just that reason if I didn't have to pay a monthly fee to NOT use it. If they'd come out with a "pay for the call only" cell phone, I'd keep one just for emergencies. But then again, knowing MY luck, just when I needed the damn thing, it would either
A. not work due to my being out of range, or
B. the battery would be dead.

> Just funnin.

Thanks!

>

I wonder the same thing with all of those "megawatt" keydowners. Just what long term damage will happen when exposed to the RF field produced by multiple killowatts in close proximity? I know I certainly don't want to find out the hard way.

I'm hoping that my relatively low power levels, and the distance from the antennas, will lessen my exposure to RF damage. Time will tell, I guess.....

In my area, the skip doesn't completely fade out until 8 or 9 O'clock,
depending on what other atmospheric conditions are present. Sometimes
it's sooner, sometimes later, but 8:00 is the average.

They have those now. You buy the phone, then you buy a cell phone
card that has a certain amount of minutes on it. I think they are
advertized at like Target or Walmart or one of those type stores.

What the FCC needs to do is take the 10 meter band away from amateurs.
They could now make it illegal to produce or sell 10 meter amps in the
U.S. Then, expand the CB band to 80 or 120 channels. Giving more
room for one of the most crowded and highly used bands around.

Just people chatting lightweight talk. Its always been that way. A
few occasional morons piping in their ridiculous brain burps.

I heard something pretty funny the other day. I think I've heard this
guy before to. Anyway, its a guy on channel 38 LSB who just sits
there and about every 5 minutes keys the mic and says "Shut the f%@!
up." He just keeps doing this over and over every 5 minutes. He
doesn't yell it, he just says it. It may be a digital sample that is
being played over and over because it sounds exactly the same
everytime its transmitted.

That is true and false. It has been noticed that companies
inventories are going up due to the expected possible interruption
in supply channels. And at the same time, consumers are purchasing
survival gear and such just in case the electricity/heat goes out.

Actually I have a CB base, 2 shortwaves, a computer, a scanner, a stereo/tape/CD, a TV, a VCR, and real audio on my computer.

So, I have a pretty good choice of what I can listen/watch while working on my computer.

Well, I cdon't know about the LED display off the flex, but the
'channel'
designation should be the same for a bunch of rigs. Like the Radio
Shack TRC-449, TRC-457, and TRC-458. There may be variations
in how the LEDs were 'attached' but even there it should be easy
to figure out.

If you want the 'decode' for the channels, I can dig that out. From
there
you can figure out anything else you need.

Good radio!
The SSB channels are channels 36 through 40. At least officially. And there is a LOT of traffic on them most days, and many nights, lately.
Some operators use the frequencies above channel 40 (27.405 MHz) which is not legal but a lot of people do it anyway. :-)
Have fun, and welcome back!
Mike

They are NOT the same cords. Telex was originally using the same cords on the RK 56B model but changed them to a cheaper "look-alike" after the anniversary models came out.

If you don't believe this, take a new cord and barely slice it at the end. Look at the differences in how the Astatic and the RK cords tear or separate. The RK 56B cords are softer material and don't hold up to flexing or strain quite as well.

As to the output levels, you may be correct. BUT, the audio bandwidth is much wider on the 636 and i typically see higher peak power levels out of the 636 IF the radio has the capability to reproduce low frequencies. As i said earlier, it may not sound as sharp but it would be louder and more powerful.

What happened to your claims about them both using the same switch and using capacitor based filters ? Neither of those statements are correct. Sean

>
Jack Thurston wrote in message <384E16EB.5B85F940@cybertrails.com>...
******

The RK-56B comes with the same lightweight
mic cable that the 636 does. As far as output,
the RK-56/B delivers almost 2x more millivolts
of audio signal to the low impedance input of
the transistor rigs on the market today. I
don't know what you are smoking over there, but
you need to give it a rest.

I'm glad that I'm not the only one with "the sickness" (as my wife calls it). I do have some limits though. I don't collect any old junk, but more of the "classic" radios that people swore by in the "good ol' days".

I have 2 858 radios. Hopefully the audio chips stay healthy, since you can;t get them anymore, although I have had some success retrofitting another type of chip, and rewiring the pins. I don't know if there is a pin for pin replacement.....

THE QUESTION WAS WHAT IS A LINEAR AMP?

A LINEAR AMP IS AN AMP THAT OPERATES IN THE LINEAR REGION OF IT'S CHARACTERISTIC CURVE.

AN EXAMPLE OF THIS IS THE CLASS A AMP AND THE CLASS AB AMP WITCH IS A CLASS B AMP WITH THE LINEARARITY OF A CLASS A AMP.

I THINK YOU GUYS CAN PUT THIS TREAD TO REST NOW SINCE HIS QUESTION HAS NOTHING TO DO WITH THE FCC, OR AND THING ELSE YOU ARE TALKING ABOUT.

This topic is like the hands on a clock.

They keep coming around.

I think Steve or someone confirmed a couple of month's back that Dennis,
#12, helped with a 'new' bias circuit which I believe was on the base
amp's.

This refutes Boba's statement below!

Phil / UK

1. Make sure its nothing but free

2. Whats wrong with it....? Something since the pills are out of it.

3. Should somehow get it checked out before dumping money into it.

I strongly suggest you pay nothing more than $0.00 (free) for it. I've seen many buy linears without the pills in them, only to find themselves buying the pills, then they blow because of other faulty parts. Depending on what kind of pills this "box" requires (or can be put into it with little if any modification) you could be spending a lot of money, and should just then buy a known new "box"....

You better have more than a single alternator, even if you are working a power supply... I mean, Dead Motor Maul.

Besides, the 300A alternators take so much torque, they break crankshafts putting out the same power that the 250s do.

Toll Free

I ordered a little Apache 240 from Copper two weeks ago and was told it is on back order until sometime in January. I e-mailed Massie Coppers president, and got a reply. He stated that, "the FCC is cracking down on certain models of 10 meter radios that look like a CB and the Apache 240 is one of them." He further said that, "Copper has gone back to the overseas manufacturer to make the Apache look more like a 10 meter radio." This SUCKS!! Does this mean no more cheap convertible Apaches and Sidewinders? Anyone know whats really going on? Anyone selling an Apache 240? Thanks

phil would you consider adding bias a major circuit change. I think it was done mainly for ssb use on the baseamp it certainly is not for the keydown amps performance. I have a davemade with class ab bias does that mean my amp is any different than the others No its a davemade that is biased class ab. We are beating a dead issue tho...

Message-ID: <07efa1ad.ccf96f2c@usw-ex0102-015.remarq.com>
Source record: 14266

I am acquiring a Boomer Deluxe 400 Mobile amplifier.

I am told it is identical to a similar model Palomar amp.

It uses 4 Motorola MRF-455 devices and covers 80-10m.

Is there a service manual for this? (The Boomer or Palomar.)
Cost and availability? Info. online for these amps?

Specs: Bias Circuit Class AB-1, Modes -- AM/FM with
automatic SSB detection. Output is claimed
to be LO 115-135; Med 195-265; HI 385-435 PEP
Watts avg. Drive -- 3-15 watts key-down, will tolerate
spikes up to 40 watts PEP. 25db RX pre-amp.
Current draw 25-32 amps. Weighs about 5lbs.

Thanks! & 73, DavidC K1YP

Some people don't get it, do they QRM? The newsgroups are like a conversation. It starts by someone introducing a subject and, once the subject is addressed, the conversation drifts from there to whatever is on people's mind about anything even vaguely related to that (and, yes, sometimes not related at all).

I guess some people expect rigid debate with strict rules. That is not going to happen in the newsgroups - and if it did the popularity of the newsgroups would probably drop like a rock.

And do you, even for a moment, really think that is going to happen?
Not a chance. The 10-meter ham band has become an important utility
band for all types of ham activity (satellite downlinks, repeater
cross-band links, etc.).

Hello Adrian,

All you need to do is run a few jumpers in the same order as the ribbon went. This takes a little time but unless you stumble across another ribbon this may be the only way to put it back together. Try to follow as much of the old one as possible and you'll be ok. Use a small diameter wire to make it easier.

I talk to a guy on the radio who told me that he is having trouble with bleeding over on his neighbors telephone when he is talking on his C.B. radio. His radio is stock...but he does have a power mic. It gets kind of strange at this point...he says that his C.B. only comes through the phone, which is not cordless, when it is on the hook. When the receiver is picked up the bleedover stops completely. Not only does the bleedover occure only when the phone is on the hook...but this phenomenon only takes place when the C.B. transmitts on channel 4 AM, and the audio is loud enough to wake the neighbor from a sound sleep! As you can probabley guess...this is causing more than a little friction between these two neighbors, so if anybody has a solution i would appreciate hearing it so i can pass the information on to him. Thank You

Message-ID: <384F06FD.F96E458C@flash.net>
Source record: 14282

Since you are new, the first thing you need to do is sit down and read the rule book before deciding you want to modify anything. Modified radios are illegal to use for transmissions on 11 meters, despite what all the know it alls might say about the subject. After all if they couldn't modify and use illegal equipment, there really wouldn't be much to talk about here, but in any event, read the rules before you do anything you might later regret--if you violate the rules anyway, well, at least you know you were acting outside of the law.

>
>THE QUESTION WAS WHAT IS A LINEAR AMP?
>

No it wasn't. The question was, "Can I throw out something quasi-controversial and get some folks to take the bait?"

The original post was phony. Most who saw it recognized it as a troll attempt. The author came close to admitting this in some private e-mail we exchanged.

>
>I THINK YOU GUYS CAN PUT THIS TREAD TO REST NOW SINCE HIS QUESTION HAS
>NOTHING TO DO WITH THE FCC, OR AND THING ELSE YOU ARE TALKING ABOUT.
>
>

Gosh! We've never before stayed on topic for more than five posts. Why start now? :)

They all have the same main board. make your choice between those by features and price. if you want power stay with the dual final units. you can identify those by heat sink mounted on the rear of the unit.

It was the night before Christmas, when all thru the abode
Only one creature was stirring, with the radio in RX mode.

The children were finally sleeping, all snug in their beds,
While visions of Dave Mades, and beams danced through your head.

The wife was snoring in front of the TV,
As you tuned in 27.025 on your CB

when all of a sudden you heard the reindeer hooves clatter,
you think to your self "Now what's the matter?"

With the D104 still clutched in her hand,
You descended the fireplace, and saw the old man.

"Ho-ho-ho!" cried Santa, "I'm glad you're awake."
"Your gift was especially difficult to make."

"Thanks, Santa, you say as his the snow on him makes you shiver."
"That's the Jo Gunns even UPS won't deliver."

Santa laughs pulls out of his sac,
A big ol' Card saying Merry X-Mas from PROZAC.

There are two ways to do this. One can be accomplished with the PLL and the other with the clarifier circuit on the radio.

Tell the group what kind of radio you have and let's see what we come up with.

Just wondering (about every time I turn on the radio) if the FCC has done any steps concerning enforcing the regulations for the CB band. I hear many calls that sound like they are riding in the back of my pickup and then they say the call is from TX or OK. Lots of watts.

Has the FCC done anything to anybody in the last ten years or so?

I guess I'm looking for a Charley story to scare my grand kids.

<bigfoot1@megsinet.net> wrote:

|I like these radios overall, but they do suffer from inconsistent soldering
|and smaller "lands" than on other boards. This leaves less solder material
|to make contact and the greater potential for bad joints due to vibration.
|I am still working out various mods on these radios, as i don't get much
|time to experiment too often.
|
|Overall, these radios do more power than the current Galaxy models with dual
|finals. They use a different digital echo than the 73's or 99's. I prefer
|the standard analogue echo for best tonality, with the digital echo from the
|73's / 99's next and then the digital Ranger echo. The receivers are
|typically pretty KILLER in terms of sensitivity. If it's quiet out, they
|will hear things that only the early 858 SSB chassis could have picked up.
|With the current noise level that exists, the sensitivity advantage is of
|little use right now though.
|
|Be careful as to who you let work on your radio. Most shops are major
|hacks. If they do good work, they will offer a GOOD warranty on it. Sean

I ordered a little Apache 240 from Copper two weeks ago and was told it is on back order until sometime in January. I e-mailed Massie Coppers president, and got a reply. He stated that, "the FCC is cracking down on certain models of 10 meter radios that look like a CB and the Apache 240 is one of them." He further said that, "Copper has gone back to the overseas manufacturer to make the Apache look more like a 10 meter radio." This SUCKS!! Does this mean no more cheap convertible Apaches and Sidewinders? Anyone know whats really going on? Anyone selling an Apache 240? Thanks

Go download a shareware program for tutoring morse. I can't remember where I got mine, but there were many to choose from. So many it was hard to pick one. There should be enough on the web to have something turn up in a search.

I can't believe this post has been here since 1:30 and the best reply is a "probably". This isn't the group I remember.

Chris, do not put anything on your antenna! The wiring in the Christmas lights can and will alter the performance of your antenna. The SWR you set when you put the antenna up will change with the introduction of metal objects near it. If you setup the antenna correctly, the SWR will only rise.

Next, the Christmas lights would have to be plugged into a wall outlet. What if something goes wrong and the wires short (touch) the metal antenna? What if you are on the key at that time? How about if you've got that brand new Silver Eagle microphone, the big chromed metal one? These are definitely things to think about first.

It is good that you asked. Putting Christmas lights on your antenna would not be a wise or safe thing to do.

The way i figure out electrical demands is as follows: Each 2879 requires 25 amps. Multiply the number of transistors x 25 and that will give you a good idea of what you really need in terms of current draw to run the amp. This would be under almost ANY condition and doing it on a daily basis with consistent performance. Whether or not you can do this economically or realistically in terms of an installation is another story, but it does give a conservative idea of what you'll need without ever stressing anything to the max. Keep in mind that this calculation is just for the amp, not including running ANYTHING else in the vehicle.

I do agree with your statement about getting a 96 pill to run to full potential. How would you like to gain match that many transistors ???
HAHAHAHA Sean
>

-=PEAKABOO=- wrote in message <82m7qq$6ms$1@nntp5.atl.mindspring.net>...
He has got enough to swing it forward, but if he runs a lot of key then it will overload, the reason I say he has got enough, and this is said with no disrespect, is because to get 96 pills to operate at their max possible output would be a challenge in itself, let alone trying to find the right amount of drive to aquire this.

Message-ID: <1nK34.3$Z63.703@news.corecomm.net>
Source record: 14323

The Connex 3300 HP and the Galaxy 77 HML use the same board. The other two radios (Virage and RG 66) use identical boards, but they are different than the Connex and Galaxy.

In terms of power output, the Virage or RG 66 will PROBABLY do slightly more power than the other two. No guarantee's though, as every radio is slightly different due to mass production and parts tolerances.

The Virage and RG should offer better sensitivity and slightly lower noise levels on RX than the old style Connex / Galaxy boards.

Both of them need to have the boards ruggedized BEFORE they go out the door of the shop. Also make sure that you get a GOOD warranty before buying the radio and having it worked on. Sean
>
KOBAL wrote in message <82n73e$f5c$1@nntp5.atl.mindspring.net>...
They all have the same main board. make your choice between those by features and price. if you want power stay with the dual final units. you can identify those by heat sink mounted on the rear of the unit.

Source record: 14324

Dennis did make some changes to the input circuit that was being used, but 123 was unable to incorporate it into production models. Efficiency was WAY up, requiring far less drive. Even with very low carrier levels coming out of the radio, the amps wanted to saturate very quickly. This would have resulted in severe overdrive in most cases.

Far too many idiots want to pile-drive their amps. They have little concept of what saturation or IMD is. This goes for people making amps also. A perfect example would be boxes like 2 x 4's and 2 x 6's. No need for something like that if the radio is running better than a walkie-talkie. One driver transistor with a decent radio will more than drive them into saturation if the circuitry is efficient. Sean
>

PowerStation <8675309@aol.com> wrote in message ...
phil would you consider adding bias a major circuit change. I think it was done mainly for ssb use on the baseamp it certainly is not for the keydown amps performance. I have a davemade with class ab bias does that mean my amp is any different than the others No its a davemade that is biased class ab. We are beating a dead issue tho...

Message-ID: <kOK34.7$Z63.1091@news.corecomm.net>
Source record: 14325

This can be done, but isn't worthwhile. It would do slightly more power, but the driver section of a 667 is severely detuned as it is. You would need to do quite a bit of work to really see a major difference once you changed the pill.

That is one of the reasons that Dennis and I recommended using a Mod V+ to drive their 500. It will do measurably more power and do it cleaner. Sean
>

R.J. wrote in message ...

881. Re: WHAT IS A LINEAR AMP ?

Newsgroup: rec.radio.cb
Date: 1999-12-09 00:00:00 UTC
From: Joe 2NC605 <2nc605@usa.net>
Message-ID: <82orf1$b2b$1@nnrp1.deja.com>
Source record: 14330
Body handling: HTML body converted to readable text

A linear amp is an amplifier that has a signal input and a signal output. The output signal has all of the characteristics of the input signal (linear) but is of a larger amplitude than the input (amplifier).

Linear simply refers to the signal being amplified without distortion. However, if you overdrive the amp you distort the output, and it is no longer a linear amplifier.

RF energy can be dangerous (health hazards/interference), and Ham operators are supposed to be trained to operate them safely. Not always the case, but that is the reasoning behind the initial rules.

> hearing it so i can pass the information on to him. Thank You

Well, this is a strange one. I assume you mean that the neighbor can
hear his transmission through the speaker of the telephone handset.

The obvious answer, at least until a solution can be found, is to stop
talking on channel 4, especially during the hours of darkness (let the
neighbor get some sleep).

Now, the problem sounds like it may be in the telephone itself. The
guy may want to take his phone over to the neighbor's house and plug it
in. If the problem is eliminated with another phone plugged in, the
solution is for the neighbor to get rid of the cheap phone and buy a
better one (tell him this gently).

Check to see if the neighbor is using a long extension cord between
the phone base and handset. If so, try changing back to the stock cord.
If that eliminates the problem, have him buy another length of
extension cord (the cord he has may be the perfect length to act as an antenna).

Tell the guy to take a good look at his own setup. Is his antenna and
radio properly grounded? A poor ground can lead to interference on a
neighbor's electronics.

What about relocating the antenna? Can the guy move his antenna
further away from the neighbor's house? This could mean raising the
antenna higher or moving it to the other side of the yard.

Just some ideas to try. Hope it helps.

884. Crosstalk between wireless mic and _CB_ intercom?

Newsgroup: rec.radio.cb
Date: 1999-12-09 00:00:00 UTC
From: van@crl.nospam.com
Message-ID: <van-0912990251330001@as54-154.okldca.pacific.verio.net>
Source record: 14333
Cross-posted to: rec.radio.cb,rec.radio.amateur.misc

Do FM wireless mikes interfere with either cellphones or 49 MHz intercoms?

Probably simple question: our church group stages Christmas-concert-like events where the performers use FM (170MHz?) wireless microphones and the stage crew uses 49.830MHz intercoms. Lately we've been encountering intermittent buzzing interference through the mikes.

(Incidentally, the intercoms also have been getting interference on the "A" (49.830MHz) and "B" (49.845MHz) channels. It sounds digital, so I suspect it could be from neighborhood R/C cars. Switching to channel "C" (49.860MHz) seems to aoivd the problem.)

The sound guy (usually a DJ volunteering his time) says the buzz from the mics are because of the intercoms. Another is saying it's due to cell phones in the congregation. Does either explanation seem reasonable?

It doesn't seem likely to me -- the harmonics don't add up -- but then, what do I know? Thanks in advance.

>
> -RC

A filter will only reduce the level of noise present - it does not usually cut it completely. Now, if the interference is minor, these filters will cut it enough to eliminate the problem. But, if the interference is severe, the filters will not cut it enough to stop the problem.

The level of attenuation is often based on the price you pay for the filter. In general, the more expensive the filter, the more attenuation it has. To eliminate severe interference, you want a filter with a high attenuation capability.

Of course, first take a good look at your radio setup - it is always better to solve the problem without filters if possible. The main cause of interference is a poorly grounded system. Are you antennas grounded? Is your radio grounded? Is the power supply grounded?

Remember that we're referring to a RF ground, not the negative ground of the radio. This means a good ground wire/strap ran from the housing of the radio to the outside and connected to at least one copper rod driven into the ground. The same with the power supply.

In the case of the antenna, we're talking about a ground wire ran from the base of the antenna to a ground rod. Or you can also often just ground the antenna mast itself since the antenna is usually mounted directly to it (the mast can act like the wire).

And then check the quality of the signal put out by your radio. Is it over-modulated? If so, have the radio adjusted by a good technician. Over-modulation causes harmonics, especially when amplified (see below). Harmonics cas easily interfere with other electronics.

Are you running excess power. In many cases, the radio equipment used in the citizens band is not built to a high standard of quality. If a linear is used, it amplifies whatever comes out of the radio. If the signal is "dirty" due to poor design of the radio, the harmonic garbage will be amplified right along with the desired signal - usually to the point of causing problems, when it did not cause problems at the lower power levels that the radio was actually designed for.

There are many books on the subject of RF interference. You may want to hunt one down to learn more.

Cobra 148F GTL mobile CB radio with Freq counter , this has upper and lower sidebands , the radio has the deluxe dual stage echo , Donkey fart roger beep , regular roger beep , Plays The Bonanza theme from a chip toy , also has the high priced "Repeater" which you can record up to 10 seconds of the incoming recieve then play it back (copy Cat stores it then play it back any time , re-recordable) , also has channels mods above and below the regular 40 channels , has talkback , external speaker , Astatic noise X mic , the power has been turned up (keys around 4 watts swinging to 12/20 watts (depending on meter) , with the modulation opened up too , this is fully loaded and is a clone of a Galaxy 88 radio , if you look at it and a galaxy they look a like . This radio has been used by me and works good , it is in good used condition with all switches mounted on bottom of radio (6) , plus the channels are in the places of a few of the not needed push buttons on front , the radio has so many toys the speaker had to be removed , the radio is for someone that wants a fullboat modified radio with alot of toys , a copy of the owners manual is included . These radios are not made anymore and are very hard to find , don't let this one get by you . There is over $650.00 invested in all the toys and work done . buyer pays Shipping/insurance/packaging of $15.00 in lower 48 which is 1st class shipping Priority US Mail.....I'm asking $300.00 for it

Hey DH,

You will find this newsgroup to be a LOT like CB. If you don't like people f*cking with you, sell your radio now! You don't want to push me, either. I work at an ISP and I can find out anything about you with one phone call to Logical.net the parent company of Capital.net. I still have access to the full whois listing, not the abbreviated version you now get. Remember, mail bombs are illegal. So is harassment. That is what your actions amount to. Lucky for you I've been real busy this week...

A recap of actions:

"Nobody can find where I'm coming from" -Spiker

"You are around Albany, NY" -Unit 69

a bunch of sh!t from Stephen in the NG.

285 "Lame Toy" messages in my mailbox which I deleted and ignored.

Where did I cause you any grief? (yet) Your actions were unwarranted. Get a life. The radio and the NG are entertainment.

My advise to you is this, Do the following step by step until the problem is sloved.

1.Have your radio checked out buy a good radio tech and have the radio put into alinement.
2.Install a copper grounding rod outside the window of your radio room and ground all your equipment to this rod.(not the ground on the power cords)
3.Install a good Low Pass Filter into your coax.This would be that last thing in-line before your anntenna.(RF Parts has a nice one)
4.Install a High Pass Filter on any T.V. set you my be coming over.($5.00 at radio Shack)
5.Install chokes on the speaker wires of your stereo equipment.
6.If all the above don't work, then you are putting out too much power for your area.

Good Luck

>I just got a Workman TVI-2K TVI filter in the hopes it will prevent me

I had heard that somewhere. I don't know if this was made into a law, or
if it is regional in nature and up to the whim of the cell carrier. I
guess I can't really try it unless I have a real emergency. I do have a
deactivated cell phone from when my wife worked for a cell company,
which still works enough to get the standard "if you would like to sign
up for service" messages. Heck, I'll stick the phone in my glovebox and
if I ever need to dial 911, I can try it.......

It would seem from your post, that Copper doesn't sell the rig for that price either. You don't have one do you?

I could advertize any rig for $10, and if I tell everybody that I'm out of stock, backordered or busted by the FCC, I can still be the guy with the best prices in town (but never actually sell anything).

> Current draw 25-32 amps. Weighs about 5lbs.

these draw a lot more current than they should. somewhere is some real ineffecincy. mine did about 300 watts ssb on a rms meter driven by a hr2510. sounded good but it heats up real bad. if you have a big enough supply and a fan it will be a nice little amp.

Good luck and best regards from Tim 082.

You tried this on eBay, where people usually bid way more than an item is worth.... I'll give you $180.00 for it... Dont care much for the work done, that counts as depreciation.... as far as it being a Galaxy 88 clone, why do you keep saying that..? Does this thing have FM? Im assuming then it has some sort of variable/selectable RF power knob/switch? I assuming then it also has a 10 kHz + switch? 4 swinging 12/20?

In other words, a more realistic price (if you plan to sell) would probably be....

$90-$100 148 F GTL (used)
$40-$50 Repeater
$25-$30 Bonanza
$30 Connex (real Connex)
$25-$30 Mic (used is used)

Dunno.... Try and ask for $220-$240 for it.... But good luck with getting $300.00...

910. Connex 4800DX - good radio?

Newsgroup: rec.radio.cb
Date: 1999-12-09 00:00:00 UTC
From: Darren Ream <reamesq@swbell.net>
Message-ID: <384FCE29.C7AC6483@swbell.net>
Source record: 14359

I am about to purchase a Connex 4800 DX, but I thought I'd get some opinions on it first. The radio will be used both on 10/11 meters for SSB. I've heard that it uses the new "6900" mainboard which, according to the dealers wanting to sell me the radio, is a big improvement over previous boards especially for SSB. What, if anything, makes this board so great? Also, is it true that the Connex 4800DX and the Cobra 148F GTL DX+ are totally identical, and, in fact, come off the same assembly line? What about quality? Are these Malaysian or Chinese manufacture? Any thoughts, opinions, or experiences regarding the Connex 4800DX/Cobra148FGTLDX+/6900 are appreciated.

At present I have an old Cam Cobra 88, 23 channel, and one of
those fiberglass 5/8 antennas. At the "time" when almost every
body had a Cb, I sold 'em from my home. So I ''went thru'' a bunch of

them, I see the big units now on ebay, and would kind a like one, but
what 'stands out most' in my memory is how a Pearce -Simson Pussy Cat
with a TU G8 D104 sounded. I sold one to an operator here in town
about 6 miles from my house, he had his antenna at about 40 feet, but
was on a slight hill, every time he keyed the mic it sounded like
someone kicked a bass drum. I could not believe it . I just ''knew''
he was running power. As it turned out it was just a case of
'everything working together', When we (local cbers) were coming
into town, his station was ALWAYS the first station we heard......
that was quite few years ago, and if I had my " drethers" I would
like a
station like that. What is funny , I sold those units (about15) around
here, now I cannot find one. To sum up, that "Station" is the one I
wish I was talking on. Just my nickel. C. Lorentson

I hate when someone looks at, say a $70 item & says something stupid like: "Copper has 'em for 60 bucks, can you match their price?"", (to which I usually respond: " OK , if you insist, That will be $80 bucks please....!)

922. Thoughts on Lakeview Antenna Company (Hamstick)

Newsgroup: rec.radio.cb
Date: 1999-12-09 00:00:00 UTC
From: richard@nospam.com
Message-ID: <384ff6c1.2469870@172.16.1.166>
Source record: 14371
Cross-posted to: rec.radio.cb,rec.radio.scanner

Anyone ever deal wth Lakeview.

I bought an On The Glass CB antenna 4 months ago. The antenna mast snapped off. I called and asked about warranty. They immediately accused me of hitting something with it, which I did not. I have two (2 meter & scanner) other antennas placed right next to this one and they are just fine. I am sending it back to them so the "can examine it" (per the manager), to see if I hit anything. Then they will decide if they will replace it then.

The antenna cost is $17.95.

Your thoughts are appreciated.

The radios on Ebay alone are going for $175-$225.00 , and everyone knows how much the toys really cost and how much all the work done would cost a person in a shop , I have no intention of arguing on the board , that is not what this board is for . The radio was up for Auction and brought $255.00 , close to the $300 reserve , If no one wants it here , it will be relisted on E-bay , My feedback that has been turned in on E-bay is assurance that your getting quality .

Thank You all for letting me post the rig and have a nice Holiday season.

They got me in '95,they are very good to deal with and treated me so
well that I couldn't help but change my ways.That and the fines if I
didn't cooperate.
The agent I dealt with(Mr. Anderson from Washington state)said they
were more interested in people on freqs they shouldn't be on but
amplifiers and intentional interferance were also biggies,although way
down the list.

<<Does any one know of a good way to study Morse Code? I memorized the Alphabet but it doesn't seem to help.>>

People think they should be able to get it all right away, and when they can't, they just give up. It doesn't work that way. It takes a couple of weeks. Try listening to slow code (from a tape, software, or off the air) for ten minutes or so. Write down any characters you recognize. Don't sweat what you miss. Then review the morse alphabet and numerals at the end of the ten minutes. Do this several days in a row, and you'll find that each day you recognize more and more. Within two weeks, max, you'll have it down solid. Good luck.

I recommend "Jerry Ziliaks(KB6MT)high speed code course.I tried some
other things then got his tapes and went from 0-20WPM in in 5 months and
only played the tapes while I drove my mail route,didn't even pay
attention!
The key is they start out at a 20WPM or so character speed with long
spaces and then shorten the spaces,the way the ARRL and other courses
work the characters sound way different at 5 than at 20,you have to keep
learning the language over and over instead of just ......
well its like listening to a person talk that pauses a lot verses
someone who never leaves a break,the language is the same but one gets a
lot more said.
The hardest part will be unlearning what you know.

Advanspec,
Well you do have a point. Copper is a little high when it comes
to shipping. But say for instance, I buy a D-104 M6 from Copper for $39
and add another $6 for shipping, comes to $45. Why shouldn't I buy it
for $45 from Copper verses $70 for the same item at the local OVER
PRICED cb shop? How much do you sell your D-104's for?

I must say you guys are very helpful. I'm sure most of you are hams since
you went out of you way to lean Morse code.
I'm glad to see you guys help out the Cbers.

Merry X-mas PROZAC Said that!

The real irony is that all of those "mods" and "toys", while incuring an
additional cost, do not increase the value of the radio to any serious
radio user. The radio would be worth more to me in bone stock condition.

All that the work means to me is that the radio has had many hands
inside, and the performance and/or reliability is likely to suffer as a
result.

This is what you have to keep in mind when you are selling something.

Would you pay double the going rate for a used car, that was adorned
with fuzzy dice, chain steering wheel, hot 2 tone custom pink paint, a
"la cucaracha" horn, custom wheels that are not to your liking, shag
interior, and seat covers (also in pink)? These things all cost money to
install, but they do not add to the value of the car to anyone other
than the person whose (strange) taste created it.

Please tell me another one. Go for it I will love to see you try and link anything back to me. If your so damn good lets see how good you are. I never tried to impress anyone actually. I came on here looking for help and to see what other cb'ers were like. A selected few of you have nothing better to do then to come on here and start shit with people. What people on here think of me is there problem. But I dont sit around and take shit from anyone especially on the fucking computer. Im here to get help and possibly find people to talk to on the cb. If you want to be here to fuck with people then so be it. But you fuck with me and I"ll fuck right back.

Handy Andy <CodysPC@Iserve.Net> wrote in message
news:384da578.88107004@news.iserv.net...
> Greetings!

Just for grins here's my interpretation of what happens.
On Am, (assuming a SSB rig) the carrier is generated by
unbalancing the balanced modulator IC so that it puts out a carrier.
The frequency of this carrier is set to make it centered in the xtal
filter's passband. This ensures minimum attenuation through the
filter.This frequency is then mixed up to the wanted output
frequency.
Once at the wanted output frequency, the carrier is amplified
through successive stages till it hits the driver and final wherein
the modulation is applied. The driver and final's job is two fold.
They amplify the carrier and are used as mixers. The mix being that
of the carrier and the audio frequencies used to modulate the
carrier.
There are a number of ways to impress the audio onto the
carrier. The most common ways are through a transformer or by direct
dc.coupling the audio amp to the final and driver's B+ line.
I think I'm safe in saying that xformer coupling is not
generally used in present day SSB rigs. So this leaves dc coupling
of the audio amp to the B+ line.
In the average dc coupled circuit, the final audio power amp is
biased to provide enough dc output voltage to the final and driver
so they can amplify the carrier to a nominal level. This bias
voltage is adjustable to compensate for variances in gain of the
previous rf gain stages.
Modulating the carrier is pretty straight forward from here. You
apply a small audio voltage to the base of the modulator/regulator
which causes the output of the modulator/regulator transistor to
change voltage at an audio rate. The B+ line is now carrying a
combination of DC and AC much like the xformer coupled circuit.
With a few differences.)
On SSB, the balanced modulator is this time fed with two signals
instead of just one. One is the rf carrier frequency that was
generated prior to the balanced modulator and the other is the
modulating audio frequency. Since there will be two sidebands
generated at the output of the balanced modulator there needs to be
a way of removing the unwanted sideband. This is accomplished by
setting the carrier frequency to one side of the xtal filter's
passband. What then happens is the opposite sideband is removed due
to the sharp filter skirts of the xtal filter. The new signal is now
mixed up to the wanted output frequency and linearly amplified all

the way up to and including the final and driver stages.
The modulator/regulator that was used in AM is also now in play
except that it is now biased to put out the max rail voltage. i.e.
The switch you were referring to. There won't be any audio voltages
applied to the base of the modulator/regulator transistor like AM so
the voltage on the B+ line to the final and driver will stay just dc
at max potential.
I realize I've left out a number of details but this is my
rendition of what happens on TX between an SSB and AM signal.
How far off am I ?
BobC

Had an inspection in Feb. 1980 to my Ham Station due to Cable TV People
saying I was "cutting up" Channel 18 (144-148mhz) (also HBO down here)
so the FCC checked me out and the cable co! I was clean and the cable
co was leaky and had to fix their leaks or risk getting shut down for
intereference to Aircraft users, Marine and Ham. Their biggie was and
is illegal freq use with CB and Amps down on the list. They will
investigate if you make a nuisance out of yourself. Excellent
professionals but serious in their work and I have made it a special
note to keep on very good terms with FCC, learned alot from these guys
(local FCC guy in NOLA is a ham and very active).

Let me just say that if you want customer service, go with Larsen. Yes they will cost a little more up front, and they might not look as sleek as some, but you can't beat the warranty. 3 years. One time I called them and said I had a probem with a dual band rubber duck, they sent me a new one and said just destroy the old one, no questions. Another time I had a coil on a 5 year old antenna crack (yes, I told them I did not have a receipt and it was 5 years old), they still replaced it free. Larsen has great customer service.

Petition for Rulemaking
In the Matter of

Amendment of Section 95.413(a)(9) CB Rule 13
Prohibition of Communications or Attempts to
Communicate with Citizens Band Stations
More Than 250 Kilometers (155.3 Miles) Away.

Petition for Regulatory Relief of Burdensome
And Unnecessary Rule that Inhibits the Public's
Simple and Unencumbered Access to this
Communications Service.

GREETINGS:

SUMMARY

Although Subpart D Citizens Band (CB) radio is intended as a short range
communications service1, users should not have to concern themselves with the
possibility of inadvertently contacting another CB station farther than presently
permitted by rule. Further, CB operators should not be constrained from contacting
distant CB stations in order to facilitate communications necessary for personal
convenience, navigation, traveler assistance, and least of all emergencies and
disaster communications.

The propagation characteristics of frequencies surrounding the 11-meter band are
well understood to be capricious2 and, in as far as the average consumer is
concerned, unpredictable. Utilizing a consumer device such as a CB radio should be
a simple and unencumbered process. A user should need only to exercise common
sense and courtesy, not posses a technical understanding of High Frequency (HF)
radio wave propagation, nor a regional geographic frame of reference limited to an
arbitrary radius.

DISCUSSION

Whereas; the Federal Communications Commission (Commission) has objectively stated that unnecessary and burdensome regulations should be eliminated or streamlined3.

Whereas; the CB Radio Service is intended primarily for use by consumers and small entities4, rather than by trained or licensed operators or technicians.

Whereas; in spite of sporadic communications that do occur beyond the existing 155.3 mile limit, such communications will not substantially alter the primary use of CB as a short range communications service. This has been well evidenced for decades, particularly through and during the previous and present 11 year solar cycle peaks. Such long distance (DX) communications can and do occur on a frequent basis, with or without the knowledge of the operators involved. Such DX

communications have not materially affected the given short distance purpose use of the CB Radio Service, as demonstrated by the functional, actual everyday use of short distance CB radio communications by such entities as over-the-road truckers, automobiles travelling in groups or caravans, and neighborhood watch groups. Admittedly, there are times when communications from distant stations do interfere with local communications. This occurs however, whether the distant interfering station is communicating with a local station, with respect to the station being interfered with, or with another distant station. There is little operational control that can be exercised by any party in this example, except common courtesy under existing CB radio traffic rules relating to permitted communications and priority of traffic.

Whereas; nothing in this petition seeks to permit the operation of other than presently type accepted or certified CB radio equipment. This petition does not in any way seek higher authorized transmitted power output levels or expanded operating frequencies or any sort of refarmed channelization plan. Additionally, nothing in this

petition seeks to change or add to existing modes of communication presently
authorized in the CB Radio Service.

Whereas; CB communications utilizing authorized 12 watt Single Sideband (SSB)
mode are more likely than 4 watt Amplitude Modulated (AM) signals to travel longer
distances by means of ionospheric reflection (skip)5. Additionally, these higher power
SSB signals are more likely to travel greater distances as ground waves as well6.
Therefore, it is even more difficult for SSB mode users to determine the range of their
communications without actually first establishing an errant DX contact.

Whereas; emergency communications should never be subject to any law, rule, or
regulation inhibiting the immediate transport of such message to any station in a
position to render aid or to forward such message.

Whereas; disaster relief communications, including tactical relief logistics, health and
welfare traffic, and point-to-point communications between and among relief and
public safety agencies, organizations, and individuals need not be restricted from
making maximum use of the low cost and ease of deployment of CB radio equipment
to mitigate the effects of such disaster.

Whereas; motorists and other travelers need simple access to their CB communications without regard to having to assess their immediate location in
reference to other potentially distant stations. This is particularly true for motorists
who are presently required to know not only their instantaneous location, but also
potential distances of stations contacted. The present rules require such traveler to
figure a dynamic regional geography extending well beyond 155.3 miles, in order to
avoid fear of running afoul of this regulation simply by keying the microphone and
contacting the "wrong" station. Relief of the distance of communications limitation
will enhance driver safety by allowing CB operators, while driving, to complete their
communications promptly and thereby devote more attention to the

operation of the
vehicle.

Whereas; CB calls and communications for the purpose of determining the utility and
operational ability of legally authorized CB station equipment and antenna systems
should be unencumbered of distance limitations. Such relief will enhance the value of
such test calls and communications, and establish operator confidence in both the
reliability and limitations of the band and such CB station equipment. Such on-air
testing including DX calling would not materially disrupt the existing, ongoing,
purposed, and predominantly de facto use of the CB Radio Service as primarily a
short distance communications service. Again, this scenario has been well evidenced
for decades, particularly through and during the previous and present solar cycles.
And still again, such DX communications have not materially affected the given short
distance purpose use of the CB Radio Service, demonstrated by the functional,
actual everyday use of short distance CB radio communications by such entities as
over-the-road truckers, automobiles travelling in groups or caravans, and
neighborhood watch groups.

Whereas; the absence of the 155.3 mile CB communications limit will serve to relieve
FCC enforcement personnel of a portion of their workload, freeing such resources for
more important enforcement issues such as dealing with cases of patent abuse of
the band including malicious interference, profaning, and music broadcasting.

Whereas; until contact with another CB station is actually commenced, the calling
CB operator has no way of knowing if the station contacted lies within or without the
presently authorized 155.3 mile radius! Thus, inadvertent and otherwise innocent
violations of the 155.3-mile distance limitation do occur. Consumers must be
protected from this unreasonable, unnecessary, ineffective, and no longer useful
regulatory burden.

SEEKING

Now therefore; this petition seeks regulatory relief by these means:

1.) Immediate repeal of 47 CFR ï¿½95.413(a)(9) found within CB Rule 13, herein
paraphrased: "You must not use a CB station-- ï¿½ To communicate with, or attempt
to communicate with, any CB station more than 250 kilometers (155.3 miles) away;"

2.) Modification of 47 CFR ï¿½95.413(a)(11) found within CB rule 13, herein
paraphrased: "You must not use a CB station-- ï¿½ To communicate with stations in
other countries, except General Radio Service stations in Canada;". This section
should be modified to permit communications with stations in other countries,
subject to any restrictions or exclusions that may be imposed by either the
International Radio Regulations of the International Telecommunications Union, or of
the government of any country affected so by. In any event, unrestricted distance of
CB communications must be allowed within or over any area of the world where radio
services are regulated by the FCC, including within the territorial limits of:
The fifty United States.
The District of Columbia.
Commonwealth of Puerto Rico.
The Caribbean Insular areas under the jurisdiction of the FCC.
The Pacific Insular areas under the jurisdiction of the FCC.
Any other area of the world, except within the territorial limits of areas where radio
services are regulated by-- An agency of the United States other than the FCC.
(Subject to its rules.)
Any foreign government. (Subject to its rules.)
An aircraft or ship, with the permission of the captain, within or over any area of the
world where radio services are regulated by the FCC or upon or over international
waters. You must operate your CB station according to any applicable treaty to
which the United States is a party7.

The present authorization to communicate with said Canadian stations must continue
to be embraced. Further, any rule change relative to this petition must clarify that

such communications with Canadian stations is always permitted, any extant
distance of communications restriction notwithstanding, whether or not such had
been the original intent of ï¿½95.413(a)(11).

3.) Modification of 47 CFR ï¿½95.418(b) found within CB rule 18, herein paraphrased:
"How do I use my CB station in an emergency or to assist a traveler? ï¿½ When you
are directly participating in emergency communications, you do not have to comply
with the rule about the length of transmissions ï¿½ You must obey all other rules." The
statement "You must obey all other rules." is unnecessary, must be stricken, and
language inserted that adds in essence, "You do not have to comply with any rule
about communicating with or attempting to communicate with any CB station more
than any specified distance away." This change is necessary to expedite response of
emergency services in an emergency, so as not to further endanger life safety or
property.

4.) Modification of 47 CFR ï¿½95.418(c) found within CB rule 18, herein paraphrased:
"How do I use my CB station in an emergency or to assist a traveler? ï¿½ You may
use your CB station for communications necessary to assist a traveler to reach a
destination or to receive necessary services. When you are using your CB station to
assist a traveler, you do not have to obey the rule about length of transmissions ï¿½
You must obey all other rules." The statement "You must obey all other rules." is
unnecessary, must be stricken, and language inserted that adds in essence, "You
do not have to comply with any rule about communicating with or attempting to
communicate with any CB station more than any specified distance away." This
change is necessary to expedite information of necessity or convenience to motorists
and other travelers.

The proposed rule changes herein are clearly in the interest of the public interest,
convenience, and necessity and appropriate to the new deregulatory

momentum8 of
the Commission. Your careful and prompt consideration is greatly
appreciated.

Well, I got it up and I used the clamp- it seems to be sturdy enough. It
also works great. I can't compare it to any other antennas I have had
because they were setup at a different house and in a totally different
way.

We used to put the 6KD6 and 8950s in the Trams, Brownings and Daks in the 80s....

150 watts from the radio drove the Drake L4Bs and SB220s very nicely!

Plate Modulated and all!

No.

I offered him a free internet connection (via my ISP) and a free computer
and he didn't want it.

Home is his place away from the internet, and he has found that you make a
lot more money when you spend the free time in the shop, rather than typing
on the old keyboard!

Someone needs to introduce Dominator to the MRF421.

Then you would use a 1 driven 2 driven 4 driven 6 driven 8 driven 12 driven
16 driven 24 driven 32, and STILL wouldn't overdrive a thing!

That will end up in the hands of a truck driver.

Not knocking them, but it always seems that the bastard CB radios end up in a JB Hunt or Swift truck.

Once the drivers get a little bit of experience, they sell the radio to another Swift driver (this is at the same time they have the intrinsync 2 years of experience, so they are moving on to another company) and purchase a new Galaxy or RCI radio.

Just like clockwork.

Use two 17 to 18 foot pieces of 75 ohm cable to feed each antenna.
Use a convenient length of 50 ohms cable between the radio and the T
connector.

Or, get a Cobra 135..

They used two completely separate output sections...

One, Class AB with no regulation for SSB (B+ direct to the input B+ line),
and another transformer driven final circuit for the AM transmitter!

998. Re: What kind of radios does everyone have?

Newsgroup: rec.radio.cb
Date: 1999-12-09 00:00:00 UTC
From: G SEVEN <superiorwavelength@prodigy.net>
Message-ID: <82ptir$6ua6$1@newssvr03-int.news.prodigy.com>
Source record: 14542

Is this modification still being performed, and can it be done to my D201A?
That would make one less piece of equipment in cascade..

You can't go wrong with a Wilson 1000 Mag mount. Wattage is the max power handling of the antenna. Your stock 510 only does about 4-5 watts.

1001. Phasing harness question???

Newsgroup: rec.radio.cb
Date: 1999-12-09 00:00:00 UTC
From: cleve e massey <cmassey@airmail.net>
Message-ID: <0973289DA9726760.1AE19BCBA5067537.4589F396CA86C83F@lp.airnews.net>
Source record: 14545

How do I construct a phasing harness to run two firesticks on my son's pickup truck...

What kind of coax??? What is their length??? Do I use a coax T to join them to the run into the raadio??

Any help would be appreciated as it has been long time since I did this and the old brain just ain't the same...

Please respond with e-mail as I don't get to the NG very often...

thanks...cleve

No. That would be no change at all in reality. I meant that he had changed components, part values, tuning of the circuit, etc... Not just make something LOOK different. Sean

>
prozac 625 wrote in message ...
When some one says small changes are they talking about replacing a 50 Ohm resistor with the 100 Ohms in parallel? Or do they just relocate the position of the components?

go down to your local truckstop and buy an already made up harness, they
come in both 12 and 18 foot versions, I paid about 12 bucks for my last one
, they do look cool , but for total performance need to be 8 feet apart , on
a pickup one ant. works just as well , we put 2 on big trucks , because they
help cut down on the darned thing being so directional because of the large
metal trailers we pull .

For Sale:

RFI Book by ARRL, latest edition $20 plus $3.00 shipping. Loaded with information on finding and eliminating RFI intereference to and from devices. RFI dealing with Computers, Phones, Transmitters, TV, VCR, Stereo and so on.

Have some older (used) CB type books too for those interested. The older ones are like the CB for Dummies type books. These are going fairly cheap. About 10 cents to about $2 each depending on size (and age).

Have some CBs for sale. Older ones. Working, some in pretty decent shape. NOT modified. Most are 40 channel, one is 23, maybe a collectors item for those of you in to that. Bases and mobiles am and am/ssb types.

Miscellaneous other items too, from time to time.

C.L. Furlong Enterprises
514 Railroad Street
P.O. Box 289
Stockdale, PA 15483
E-Mail: Tech@DP.NET
Phone: 724-938-7808

2 way radio, cb, ham, audio repair. parts new and salvage (to fix the old stuff). Hamfest and Flea Market table year round. Consignment sales too.

If PA resident, you must include 6% sales tax. Payment accepted is strictly via Postal Money Order which gets immediate shipment. Mail comes in at 10:30 am, UPS and Mail goes out at 3:30 pm. Shipping on any items sold is extra of the price given on any item unless it is stated (SHIPPED) or (SHIPPING INCLUDED).

If interested in something listed or looking for something special, give me a yell and I'll see if I have it or know of where to get it. I often hear others here that have items up for sale. Please reply direct e-mail as I don't always get to read the newsgroups. Also, I have done business with many over the various radio newsgroups. Feel free to inquire before doing business.

Thanks for taking the time to read and above all

HAPPY AND PROSPEROUS HOLIDAYS TO ALL!

9 years old in Fresno CA., my Porta Rican step dad from New York city used to have old 23 channel? I remember I used to listen to him with his gift of the gab. The only time I would talk on it was when he would go in the store and I would wait for him in his old Barracuda and key up on channel 19 and piss off the truckers! I was a little kid and I would get scared, when my Dad would get back he would ask me what the hell I was doing hiding under the back seat. Then around 21 I got married and homeboy from South Central named California Cool Aid who talk on the radio gave me a Idea, I was trying to settle down so I got into the radio so I could get out of the house but still be at home for the ol' ladies sake. I started out with a swapmeet Realistic Radio "Navaho" for $10.00 with a coat hanger for a antenna. Serious. Got key on and now I am 31 have been doing the radio thang ever since. And yes I am still married and yes I am still getting keyed on.

Tune into some QSO's in progress and try to copy the slower ones. As your
proficiency increases, look for faster speed QSO's. Start in the Novice areas
of the bands, then move out to the General/Advanced areas, and just copy
QSO's. W1AW has practice sessions on 1.818, 3.5815, 7.0475, 14.0475,
18.0975, 21.0675, 28.0675 and (yeah, like you'll receive THIS) 147.555. Their
code practice schedule is posted in QST magazine. Pick up a copy and check it
out. Also, Gordon West publishes some good code tapes. Not sure where you
can find them, but I'm sure that QST has an ad or two for them. There's also
some PC software that you can use, SuperMorse being one that I played with...

1014. Trade - UHF 16 Channel HT for SSB CB

Newsgroup: rec.radio.cb
Date: 1999-12-10 00:00:00 UTC
From: W8EMS@webtv.net
Message-ID: <20822-38512EF0-9@storefull-123.bryant.webtv.net>
Source record: 14408

No acceptable offers received yet. The Ht is still available.

Took this unit in trade. Model SPU-416-KT, 438 -470 Mhz 16 channel programmable. The radio has three channels programmed, one repeater and two simplex. 4 watt output, scan, and PL. Radio, antenna, and battery only, no charger. Seems to be in good working condition and at least a 7/10 cosmetically.

I'm not really familiar with the Uniden line and the radio was identified by my description on line. Will sell for best offer or trade. Looking for SSB CB (40 ch only - no converted 23's) or amateur radio equipment.

FAQ:
No, I can't reprogram the radio, but I'll give you the e-mail address of someone that can.
Yes, it will cover 440 ham band.
Yes, it will cover GRMS channels,
Yes, it COULD be used as a 4 watt radio on FRS.(not legal or advisable)
Please e-mail offers or questions. Thanks
Jim, W8EMS/9

My dad had one of the first CB radios in the Louisville, KY area. Must have been about 1959 or 1960. This was a four channel crystal controlled radio made by Vocaline, I believe. He was on channel 7 - the only crystals in the rig - and sometimes you could go all day and never hear anyone else on the channel!

Then, in the summer, skip started to roll in and I heard stations from all over the country. You could tell by the call letters, at that time, what state they were located in, and this got me hooked.

Dad "upgraded" his radios in about '61 or '62 and bought a pair on KN2550's from Allied Radio in Chicago. Six channel transmit with 23 channel tunable receive. Wish I had one of those now, just for the sentimental value! Remember his first call was 18Q1843 (how many remember the "Q" calls?) and later changed to KHD6106 when the FCC decided that the number call signs didn't match the international allotments for the USA.

Got my first ham ticket in 1964 while in high school, but have always enjoyed being on CB.

Sasquatch is correct. Duals on a big truck are less directional than a
single on one side. Sean

Huh? A co-phased antenna system is bi-directional by nature. A
single antenna is more omni directional. If you think that by using
two antennas on your truck, you are making your system _less_
bi-directional, you are sorely mistaken.

Nine years ago, while I was stationed at NAS Moffett Field, I use to run with a fella "Arizona Drifter" who was also stationed there. We were four-wheeling in the Sierra Hills behind Milpitas when we got stuck. I didn't have my bulky cell phone with me but Drifter had a GE Base station radio (it had both AC and DC power input) hooked up inhis truck. He said he'll try and call for help but I told him we're too far to get ahold of anyone. But he tried anyway. Next thing you know, about oh, say 45 minutes later, a whole "shabang" of trucks came out in a line to where we were at to help pull us out. Nicest bunch of guys I've ever met. I forgot most of their names but everytime I come through the South Bay, I try to break for one of the guys I remember to this day, RECOIL.

But anyhow, the GE Base Drifter had in his truck was bought by me and I bought a GrantXL from Scanners Unlimited up in San Carlos (which I still have to this day) for the mobile. And ever since then, I've been a "chronic" CBer. Day in, day out the radio needs to be on; whether it be the station or the mobile. That's my profile.

Would have been about 63 or 64, my scoutmaster and all the guys in the local jeep club had them, around these parts a lot of people couldn't get phone service without paying big dollars until the mid to late 70's,so everyone had CB's. I started out with an old 1 channel General, Then went to a Johnson 5 channel whiteface, on a big radio night , you'd slide the case off that old Johnson,and have all of your extra crystals ready to change to get more channels,used to keep mine on a flat piece of Styrofoam pirated from my mom, pushed them right down into it, then took a pen and marked the Styrofoam with transmit and receive, and what channel , ah for the good old days lol, one of the scoutmasters had co-phased super magnums, up in big Douglas fir trees at about 110 feet, sure seemed to work well with his Lafayette, and a homebrew 500 watt amp, 73's

I've never seen any list of specs, and I would surmise that you won't find any. These things are built on kitchen tables and garage benches by numerous individuals whose workmanship and design might be suspect. They will vary from unit to unit, and because they are illegal, people are quite happy to get what they get.

The television coax is supposed to be a sealed system. No rf gets out and no rf gets in. By putting a pass filter in the coax line, you will accomplish nothing if the coax was installed correctly. More likely, you are seeing fundamental front end overload, meaning that that your rf signal is getting into the TV directly through the case, or secondly, that the rf is coming in on the electrical line. I presume that you are operating an unmodified radio with legal power and that it is grounded properly? For starters, you need to see what can be done in your own home to clean up the tv reception. For the stereo speakers, modify the length of the wires running to the speakers, and it should improve the situation because the wire will no longer be resonant on that frequency.

The local guy here has a patent on this "loudspeaker removal" technology and you have to pay him $100 royalties if you do the same to your rig.

For software, go to qrz.com. Beyond that, look in the back of QST for the box ad for Ziliac's code tapes. Spelling isn't right here, but you'll find it. Good tapes. Finally, learn to listen to the letter's sound as it rolls out, not for dits and dots. If using software, set it up so that it sends the letter at about 14 words per minute, but spreads the letters out to about 3 words per minute. Learn to listen to the sound of the letter and then speed up the frequency that the letters are presented to your outer limits.

> BobC

By George, I think you might have it! Of tantamount importance is appreciating that the SSB filter is very, very narrow and performs a band-pass function. If you hack and slash the microphone audio circuit in the radio you can increase your audio bandwidth. But remember the person on the receiving end is listening to your signal through a very sharp a filter (okay some radios are crap and aren't too sharp) and if your bandwidth is wider than the receivers' filter, the fidelity of your Tx signal is going to be degraded. Another thing to consider is that some radios route the AM signal through the SSB filter so an overly wide AM signal is also going to be more difficult to copy with a "good" radio.

If you LEARNED the phonetic alphabet you already have gotten off on the wrong foot.I have seen people try to memorize the phonetics and this is ridiculous,its much easier,simpler and more effective than that....When you here the phonetic for "A" for example(alpha,america,etc.)just start writing the word and stop after the first letter! Thinking about what letter is meant by a particular word takes a fraction of a second longer.It was never meant to be something to be memorized or learned,but a new way to use something you already know.The ARRL and others do a mis-servise by printing the phonetic alphabet but what would you expect from a bunch of no-coders?

NO,in fact 11 meters opens up every year for sporadic "E" and this is
one band where all sorts of enhanced propogation will occur unrelated to
the cycle.

Actually removing the speaker and running an external is a common way
to get room for other things,this is used a lot on the 2 meter band when
a handheld needs a tone-board installed,also the speaker in the
speaker/mike can be cannibalized.

>complaining about the interference by people breaking the existing rules.
>

Another form of GIBBERISH!!! There are two types of people in this world.
People who do things and people who talk about doing things. And you're all
talk DWIGHT! I've yet to meet a CBer who would "bitch" about interference
or breaking existing rules. And with the growing demand for state of the
art recievers (TV, Telephone and Home Stereos) the quality of RF Sheilding
goes down with its price and thus bleedover from a 4 watt Cobra2000GTL.

> When Amateur Radio is added as an existing option that can meet all of

You stupid transistor people....

Q=Quality Factor.

hehe

Actually, we are both right. If you are designing a matching network, the Q (Quality Factor) would stand. If you are looking at it from a solid state reasoning, Q would be what you are describing.

I went from zero morse to 10wpm in one month - and I can't even remember my birthday! I didn't bother practicing the sending part but I did use the method where the letters are sent quickly but with lots of time between them. I'm firmly convinced that anyone can learn code. Allocate 20 minutes a day to copying random letters (slow at first and then faster) and just do it every day and you'll see.

Having read this I just *have* to open my big mouth...

>> The radios on Ebay alone are going for $175-$225.00 , and
>> everyone knows how much the toys really cost and how much
>> all the work done would cost a person in a shop

Well, there are always people that can easily be separated
from the contents of their wallets. I wouldn't give a lot
of the EBay crowd high marks for knowledge - methinks half
the people there buy an item, and then try to flip it for an
even higher price. Guess they can't get real jobs.

You're also assuming sane people really *want* this butchery.
Please let me know the bidder list on this item - I wanna
sell 'em glow-in-the-dark chrome-plated Jesus statuettes
to coordinate with their chain-link steering wheels on
their dropped 72 Chevy Monte Carlos so I can retire early ;-)

A used radio is a used radio. Mods *lower* the value - at
least to me and many others - because I don't know who the
hell did the work.

>> The radio was up for Auction and brought $255.00 , close to
>> the $300 reserve

Well, that just means $45 towards sanity, and/or a ridiculous
reserve.

>> If no one wants it here, it will be relisted on E-bay

Fine. Please spare us another posting here. If we wanna
see what's on EBay, we can easily go there. Most all here
really know what the intrinsic value of such an item is.

>> My feedback that has been turned in on E-bay is assurance
>> that your getting quality.

Hold it - pure utter unmitigated BS. An EBay rating doesn't
imply *ANY* technical competence or even morality on the part
of buyers & sellers; it usu. just means that both the buyer
got a box that works - possibly marginally - and the seller
got his money on time and the check cleared. It in no way
means that the item is a good deal, that it's a good product,
etc. - it just meant that two parties followed a few rules in
an artificial marketplace not necessarily populated by knowing,
informed buyers - like many of those that hang out here.

[COMMENT: In fact from some of the listings I've seen, I've come to believe many EBay ratings are the result of "mutual assured blackmail" - complain or post neg. info about a deal, you may get flagged in your EBay Feedback as "whiny" or "demanding" and "don't have good communications skills". (Perhaps it's better than nothing though, dunno.)

Date: 1999-12-10 00:00:00 UTC
From: cbboy@aol.com223
Message-ID: <19991209220033.17380.00000193@ng-fd1.aol.com>
Source record: 14461

I have a Johnson Messenger 3 - $8
I have a Johnson Messenger 100 - $8
I have a Johnson Messenger 110- $8
I have a Johnson Messenger (Whiteface) - $15
I have a Johnson Messenger (Blackface) - $25

All of them have a mic, but the Whiteface and the Blackface.
Don't know if they work, because of no power cord.
It's easy to fix up a power cord.

Email for any questions or you are interested.

Thanks
North Georgia Buckaroo "223"

I have a Radio Shack TRC-225 handheld cb radio. Come with antenna. No power cord, but you can get them anywhere. It's in real nice shape! No scratches or anything, you can barely, barely see'em! Asking $25

Email if interested or if you have any questions.

Thanks

I guess no one wants my " Truck Driver Special " radio .

I had used the rig my self a few times (to see if it works) and have no need for all the toys and gadgets either installed . The only thing gained here was a good laugh by you gentalmen . Thanks for all the replies and happy holidays .

d104m6b? 49.95 wired and we even throw in a battery if you ask for it
and an in store warranry you can trust. a little higher than copper
but if anybody wants to save that buck or two more power to em. we
have sold thousands of them at that price for years.

All those gadgets are quickly tiresome and will never be used again.
Then you just have a radio with a much better chance of having
something going wrong.

The Wilson 1000 is a great antenna. The wattage rating is what the maker of
the antenna says it will hold.

Huh? A co-phased antenna system is bi-directional by nature. A
single antenna is more omni directional. If you think that by using
two antennas on your truck, you are making your system _less_
bi-directional, you are sorely mistaken.

The Antron DOES have a metal collar and 2 metal places where the
fiberglass sections meet.

<snip>
It's an Antron 99 - fiberglass antenna!

here`s one
i took my cobra 25 in for some repair work the tech said two days for
the repairs i left the radio next day i heard on the tv news that the
shop was on fire
i lost my radio in that fire the shop owner keeped the money no body
was given any money for there radios destroyed in the fire
the owner disappeared every thing that was in good shape was sold at
auction i wound up with a lot of cb radio parts but the store room
where the fire was where mine & everyone`s radios were this happened two
years ago

>
>Has the FCC done anything to anybody in the last ten years or so?
>
>

Yes. About five years ago, there was a big sweep of radio shops in the mid-west, with some confiscation of equipment and heavy fines.

There was a sweep in 1998 in New York City where taxi drivers were using illegal radios for dispatching. They moved into the Amateur band and the FCC and Taxi Authority took swift action.

Among individuals being investigated, it is as the other responders have reported. The number one way to get the FCC's attention is to interfere with another radio service or with TV/Radio reception.

Justin, I guess that answers your comment about it possibly being the
local home channel. :-)

Well, Bend.., he is just going to have to find another channel until
he can get the problem fixed (it does give him incentive to get it fixed
fast, doesn't it).

Try some of the stuff I suggested. If that doesn't work, find a good
book on radio interference and try some of the stuff in it.

Good luck.

yes,11m is affected by "skip" sunspot cycles more than some other bands.it depends on wether or not the frequency can be sent back from the atmosphere..a good reference point for usable "skip freqencies is under 100mhz..hope this helps...73's

Yes Doug, I do that now. I was not the one originally with the customer service problem, another person was, I was only replying to their post. I had a bad experience with Lakeview employees (owner?) at the 1998 Dayton Hamfest and I will never deal with them again! He was rude and ignorant. The others working behind the table said he was having a "bad day", but he didn't have to take it out on me.

When i was about 12yrs old my older brother wanted to be a cop, so for christmas he got a scanner which i found myself playing with all the time (loved to listen to neighbors on cordless phone).One day one of his freinds brought of a mobile rat shack cb hooked up to a 3-amp supply with the famous $8 "back-of-set antenna" or "hockey stick' antenna....Well he plugged it into the kitchen table and told me how to use it before he ran out the door leaving me alone with this radio (tuned into the local home channel).It was pretty much an instant hobby from there on....its been years and i have been a cb'er ever since.So how has everyone else in the NG introduced to CB?

Woops, Looks like someone is getting their feelings hurt. Or the expressions here are ment to hurt someones feeling. Not sure. But remember, some people (small) may be watching this NG so lets try to express ourselves with a little more control over the english language. You can do it. Try.

Sorry, My kids read this newsgroup and I don't like them to hear or see the language. Hard enough to keep them on the right path you know.

Lets debate some more shall we.

:)

This is necessary when operating SSB because a constant carrier is not
present to hold the relay. Without the delay, there would be a lot of
chattering when you speak as the amp cuts on and off.

>
> thanks...cleve

Well, the easiest would be to find an old Radio Shack co-phase kit
that they used to sell...

Or just order a 'replacement harness' for one of their existing
kits that matches the antenna connections you want to use.

But if you insist...

Use 75 Ohm cable. RG-59 will work, but it wouldn't hurt to get
a better quality than the cheap stuff you usually find. Measure off
two 1/4 wavelength sections. Now, 1/4 wavelength is NOT 1/4
wavelength in length. The physical wavelength is the electrical
wavelentgh times the 'velocity factor'. Depending on cable, it
can range anywhere from 60% to 90%. Make up a PL-259 for
you radio end with the two cables 'in parallel', and put on the
appropriate connector for what you want to do at the antenna
ends.

When you tune (if necessary) antennas like this, it's usually easiest
if you use a straight piece of 50ohm coax to tune each one first, to
get them close by themselves, then hook them up together through
the co-phase harness and check again.

Mike

I'm just beginning my trek into learning Morse,
but the _random_ letters seems to be a key.

Learning the phonetic alphabet is pretty easy.
(Alpha, bravo, charlie...) but to use it effectively
you need to be able to do random letters.

I use automobile license plates as practice -
they give a pretty 'random' pattern.

This could probably be adapted to learning
Morse code as well.

Bryan

Yes.

A system that is not power starved will ALWAYS sound better than one that is!

And, the watts will be REAL, rather than the harmonics put out by a system being starved.

Toll Free

The best way I can suggest to learn morse code is got
go to
http:\\www.cq2k.com
and buy the tape set. I went from no morse code to
passing the 20wpm test in a year. I passed 13wpm in a month.

The method seems silly, but it works.

Just a happy customer.

Lower bands in the 10 to 20 Mhz range are more affected by the sunspot cycle
than the 11 M band. During minimum years there is still E-layer skip that is not
affected asa much by sunspots. F layer propagation is almost always controlled
by sunspot activity.

If the phone is a corded type phone there are kits that can be installed to eliminate this problem. Yout loacal phone company may reccomnd a service shop that can fix it. What is most likely happening is a rectificatoin of the CB signal in the handset portion. Sometimes a .01 uF cap across the speaker will eliminate the problem

Greetings!

While 11M [CB radio band] is involved with Skip propagation, it's kinda' hard to figure out what you mean by "other band"?

Theres a lot more CB's out there, than any other radio type I know of.

An interesting thing to think about, is called Maximum Usable Frequency, or MUF.

The sun goes thru a periodic cycle of sunspot activity, or when sunspots appear on the solar disk. These "spots" can be viewed using indirect methods to display the disk onto a larger surface like a projector. Or using special filters, you can see details around them.

This cycle have a peak, "maxima", and a lull, or "minima". This cycle takes 11 years to complete. We are currently into year #4 of this cycle.

When sunspot activity is high, the MUF is higher.

Meaning, that during low sunspot activity, when the sun is quiet, or at a "minima", the Skip Propagation level is pretty low. Compared to what is occuring now, called "maxima", the Skip Propagation level is high.

Sunspots interaction with the upper atmosphere changes the MUF available. More solar activity, usually equates to a high MUF.

But not always, sometimes those sunspots can be *very* active and cause disuptions, or when it's no longer a skip phenomenon, it's a literal blasting away of our ionosphere. This occurs when the Earths Magnetosphere [the earths own magnetic field surrounding the earth and our upper atmosphere and beyond the orbit of the moon that also helps confine electrical charges like ions have] is bombarded by solar radiation emmanating from the sun ranging from plasma to X-rays generated by solar activity in or around sunspots. When this occurs, the ionosphere, responsible for the skip you hear during the day - dissapates or or pushed back away from the sun.

Disruptions on a global scale occur when the Magnetosphere that faces towards the sun, cannot shield the ionosphere from this radiation. Both are "pushed back" away from the earths sun-lit side and towards the earths shadowed side. We've then lost the mechanisms that makes skip propagation possible.

Not to worry though, the ionosphere is very, very close to a near vacuum and is easily affected by sunlight and the pressure from solar

wind. So, us down here have little to worry about. However, some power disruptions and radio "blackouts" will be the highlight of the day due to the intensity of electrical stength these storms have. And you might get to see some very unusual Auroral displays that are nomally found in higher lattitudes, into the tropical lattitudes closer to the equator.

When the sun is quiet, the MUF is low, like in the 20M band or longer wavelengths. When the sun is active, the MUF can commonly go up towards the 6M and even into the 2M band in VERY rare occasions.

While Dancing with the Mouse on Fri, 10 Dec 1999 04:40:27 -0000, the Modem interrupted with an MNI from ""Darkside" <me@dakside-of-the-moon.co.uk>", and the MotherBoard buffered this to Video RAM:

This radio is made by Ranger. It is the same radio as the RCI 2960F. This
radio has the new improved circuit boad like the Connex 4800 and Cobra 148
GTL-DX, but with 100 watts added to it.

There are several ways. The best way is to learn each character at
18-20wpm. Once you know them at that speed it's a cakewalk. If you
start at 5wpm you'll have a HELL of a time getting the speed up.
There are several programs to learn the code, I like Supermorse. Do a
web search for it or check out:

http://www.ac6v.com/

That site has links to EVERYTHING!

A good amp will run on 12-20 Volts. Will put out a shit load more then you put into it. A good amp does not necessarily mean an amp with over night devlerery or an amp with a pretty Casing (especially if there is no fans in it).

"Gary Danaher" <gdanaher@flash.net> wrote in message news:38517FFB.4F41DCFF@flash.net...

Source record: 14585

No. [I do wish people would look for previous posts; this
and many other questions have been answered multiple times on
this or the rec.radio.equipment newsgroup.]

The HTX10 is a fine little rig: however, it is designed solely
for use by licensed hams on the 10M (29.0 - 29.7MHz) ham band
only.

On the HTX10, the PLL and CPU are combined so PLL control is all
within a single chip under program control. Since it is a high-
speed PLL, there is also no need for any "offset mixer" scheme,
thus closing down another possible modification path. Changing of
other crystals will just mangle the radio - these freqs are tied
in with the IF frequencies, filters, etc., which can't be moved.

Don't wanna "turn up" the power either - this rig runs around 30W
FM/SSB(PEP), which is near the max rated performance of the final
transistors.

A so-called "swing" mod would be senseless too as most reports are
that the mic gain really has to be throttled back to midrange for
good quality transmit audio.

One intercom was at the back of the audience stationed close to the sound
console, where I assume the base units were, but the intercom was on
push-to-talk, not VOX, and there didn't seem to be a correlation between
Tx'ing and the buzzes. Other other intercoms were scattered in the rafters
manning the spotlights, about 50 feet and more from the base units. The
mikes themselves were at the front of the pews and perhaps 75 feet from
the base units and all intercoms.

No voltage drop holds 18 volts no problem with out dropping to the battery voltage? Of course this is not true @ idle....

Thanks for answering my question on radios. I have one more question about a LA 900 amp.
Bought the LA 900 from a friend who needed money. It has never been used.. Is this a good amp? Is it high drive or low drive? How many amps does it draw to operate, and what is the little red light on the front right side for.(It says Heat)..If I use this and it needs service, is there someone who works on these? Thanks Alan

What have you done different lately?

Try a new cable between the guitar and amp.

Make sure all screws and bolts (on connectors) are tight.

You can get away with a little as 54 inches between antennae for phasing.
Depending on the phase shift between them will affect directionality.

Agreed again ...

I'd want somewone to let me know that my rig had a chirp. I don't quite understand why he would run a rig knowing that, and not attempt to fix the problem. To each their own, I guess.

The amp has always had this problem (I don't use it that often)--but
only at my house. It doesn't seem to have this problem when I use it
elsewhere--i.e. locations where there aren't powerful AM transmitters
nearby!

I have tried different guitar cables but I never thought about checking
for loose hardware--I'll do that. Thanks.

In response to my post, jeffherrings@CUThotmail.com (Hank Aaron) wrote:

Just out of curiosity... Why use QRM? Something like "static" (or something else understandable to all) would work.... I'm not bitchin'... just some do not know their Q code... though, I think it would be beneficial... but that is a whole OTHER thread... <grin>

The Q codes are well known both in amateur and maritime radio work. In fact, some police department use them instead of a 10 code. I just assumed that in a radio group QRM would be well understood.

Perhaps I should have explained that the on and off switching of the mechanical flasher in the Christmas lights produced radio interference that was detected and amplified by the radio circuits and became audible noise in the receiver, heard as popping and cracking. But, then again, that might be too technical for some to comprehend.

Now, have we wasted enough bandwith with this?

I own the Cobra version of this radio and just love it. Everything i've heard points to the fact that they are identical radios (aside from the name on the front.)

If you want information on the radio, including mods, specs, the works, pay a visit to my CB Page (link below.) It's all there!

Took in a Uniden SPU-416KT 16 channel UHF 4 watt HT in trade. I have no need for UHF. Would like to trade for VHF or 2 meter HT, SSB cb/10 meter rig, volunteer fire light-bar, or make offer.

Radio seems to be in good condition, Three channels programmed, one repeater and two simplex. Battery holds charge. I don't have the charger for this radio. Great for GMRS, business, or high power FRS radio. (FRS not legal or advisable)

E-mail replies appreciated.

Jim, W8EMS/9 KWG2939

Good Thoughts, but how do we stop ops from running too much power,
bleeding over, and ignoring every rule? Until we can get something done
on the existing rules, why add any more than the FCC can enforce.

I dont know Jim. Have we? If you wish to be a smart ass about it, Im sure we could keep this going for shits and giggles. My post was just to inform you (more so than anything else) that some DO NOT know the Q codes.. Then I continued on by explaining what QRM was, within my suggestion to you. But hey... I offended you... GET OVER IT! Also Jim, watch what you assume.... you know what is said about assumptions.....

Jim/Joe, its all the same.

Jim, W8EMS/9 wrote in message

In response to my post, jeffherrings@CUThotmail.com (Hank Aaron)
wrote:

Just out of curiosity... Why use QRM? Something like "static" (or something else understandable to all) would work.... I'm not bitchin'... just some do not know their Q code... though, I think it would be beneficial... but that is a whole OTHER thread... <grin>

The Q codes are well known both in amateur and maritime radio work. In fact, some police department use them instead of a 10 code. I just assumed that in a radio group QRM would be well understood.

Perhaps I should have explained that the on and off switching of the mechanical flasher in the Christmas lights produced radio interference that was detected and amplified by the radio circuits and became audible noise in the receiver, heard as popping and cracking. But, then again, that might be too technical for some to comprehend.

Now, have we wasted enough bandwith with this?

>problem.

The RF is being rectified by a semiconductor junction. The amplifier
is then amplifying the rectified signal. The fact that you said it is
"quite loud" indicates it is most likely getting in at the input
stage. Ferrites will be somewhat useless for AM, (.54 to 1.6MHz),
you would be lucky to get 100 ohms from a ferrite at those
frequencies. You could try a ceramic cap at the input
(few hundred pf) but I suspect that the amp already has one
already. The best way, and likely the only way is to find the
amplifier stage that is causing the problem and bypassing the
RF there.

Texas Star is very good about getting the schematics out to the masses.

They are also very good at customer service, going way beyond the call of duty.

They also run very well, and usually do a hell of a lot more than they state. I don't ever recall seeing one do what was printed on it, they always did more.

However, they are not a balls to the wall amplifier. They are designed to run at 14.5 volts... Some can get 15 volts on them and they last. If you want to run volts, you must fiddle with the output capacitance and the bias circuit, since the bias is derived from a simple voltage divider / clamp, when the volts go up, so does the supplied bias current.

I have also been supplied with all the schematics for the Palomar amps over the years.

Messengers have been a bitch to get, but I have a small collection of the originals (nothing like the ones produced today, though, so if you have one, I don't have a schematic for it).

Usually the mass produced boxes will provide a schematic (ALL Texas Stars shipped with one that I have EVER seen), and the manufacturer will allow your distributor to order one if you need it.

The only companies that I have really been unlucky getting a schematic for are the "battle box" amps, although I did get some from Cookie.

Just to clarify a little, what you got was a 2.5-watt CB, not a 5-watt.
The 5-watts is the power INPUT, not the output.

I can't say much for the unit, never used it. My personal favorite for
a hand held is the Cobra HH-45WX (NOT THE ST!)

Good luck with you radio!

How about separate channels set aside for truckers and interstate travel at either the low or high end of the band? No base stations allowed on those most of those channels. Say channels 1-5 for mobiles only with channel 6 for base stations such as travelers aid or truck stops? Maybe would help clear up the other 34?

Source record: 14712

Hi All,
I currently am using a 5/8 ground plane at 30ft with fair results. I would really like to get my antenna higher.The radials make it hard to get the ground plane in a tree,so I'm considering the A99 or IMAX2000.Is the IMAX really worth the extra cost?I like the idea of the 5/8 wave perfomance,but is there much difference in these two.Also how do they compair to the ground plane?
I've also heard some say the ground plane is prone to cause TVI.Are any of these antennas more likely to have this problem than the others?
I also have concerns about lightening at higher antenna positions.I would like to get one up about 60 or70 feet.Would these heights be cause for concern?What precautions would help?
I am having some trouble with TVI now and would like to solve this problem too.
Thanks for any help.

Source record: 14714

MC,

I'd have to agree with Sasquatch as well. It's a matter of vectors. If you look at how a ground plane works on a base antenna, each radial transmits the signal along with the vertical staff. This transmitted signal from the radials affects the "shape" of the vertical staff's propagation. For lack of a better term they "diverge" from each other. For example, if you were to take two glasses of colored water, (one red and one blue), and poured them out toward each other, you would see some mixing at the point of impact but the majority of the liquid would spread out in a north/south direction, (the two glasses being east/west for visual reference). Co-phased antennas perform in a similar manner. One antenna is directional towards one path while the second antenna is direction in the other. As the signals meet they take the path of least resistance which in the case of a semi would be forward and rearward directional. I apologize for my long post but this is part of an experiment we performed in physics and it's hard taking 20+ pages of conclusion and condensing them to one posting.

Hello Ripsy: No the Hot Rod" antennas are not available. I have talked with thier engineer, a few months ago.

However finding or making a bracket to put 5 Francis Amazers (one vertical, and four as ground radials) should not be a big problem. The SWR will be about 1:1.5, it will not be 1:1, but will work ok.

Jay in the Mojave

Toll, I have/can/still do run a davemade 16 pill with 1 - 250 amp alternator on the 16 I also do not run batteries and can hold close to the same watts with 1 -250 as with 2-250's hitting it. And I hold the same watts that guys using 3 or more 250's . I can also take a 200 and run the 16 on it now the volts drop from where the regulator was first set at say 18 volts drops to about 16 volts "remember I have no battery backup" , the watts are lower of course since i don't have enough amps to run it to it's full potential but they are real watts proven by hewlett Packard No one can tell what I am running and if it is being fed less current. Where are the harmonics coming from? If that is the case anyone with a stock charging system trying to run a amp bigger than say a 4 pill is seeing bogus watts? I don't think thats true they are seeing less watts because the alternator is only capable of producing xxxx amout of power

Yes, the repeater split capability is only found stock on the 2600.
Of course, the bigger difference is that the 2600 won't leave the 10m
band without a chipswitch. Look at www.chipswitch.com to see if it's
other features are worth it to you, if not get the 2510 which is
easily converted for cb.

If you consider that a 100% modulated AM carrier is drawing about 3.5A then a
2W "swinging" to 40W should be drawing close to 35A.

I don't think I need to tell you it ain't.

MC

You just have to look at the current meter on a bench supply to see that there
is nothing inherently "30W" about a "swinging" AM signal on this radio.

Okay, I hear what you're sayin'. And because the two antennas are not the optimum distance from one another for directionality, I think it could be quite plausible that they are more omni directional than a single mirror mount.

1247. RF Interference Problem

Newsgroup: rec.radio.cb
Date: 1999-12-11 00:00:00 UTC
From: Dave Donoho <dave@dcs.umd.edu>
Message-ID: <3852BC1B.3813BCD1@dcs.umd.edu>
Source record: 14746
Cross-posted to: rec.audio.tech,rec.radio.cb,alt.radio.pirate

Does anyone have any suggestions for eliminating RF interference that's creeping into my solid-state guitar amplifier? The interference is basically an AM radio broadcast that can be heard coming from the speaker of my amp quite loudly! I do live within a mile from an AM radio station/transmitter, but haven't experienced too much interference in the past, and none of my tube guitar amplifiers seem to have the problem.

I've tried a radio shack RF filter for the AC power line, but this didn't help. A guy at raio shack suggested building a "Farraday Cage" into the cabinet of the amp--i.e. line the cabinet with tin file or wire mesh--but I was hoping for an easier solution. Can I use some sort of RF filter on the speaker wires? Any ideas would be greatly appreciated.

> what?

The biggest difference is the 2600 can't be modified for eleven meters
(CB band) unless you change the PLL. It does not have a roger beep,
does not have P.A. It does have a repeater offset switch and a switch
to turn the RIT off and on. The 2600 also has fewer wires under the
hood. There are also some small refinements in the overall design.

I have put a Chipswitch in my 2600 and it covers 24.8-30 MHz. It also
adds a bunch of other stuff like memories. I unlocked my Chipswitch
with a password and it will dial down to 20.9 MHz, but the VCO will
let go around 23.5 MHz. I tried playing with the VCO to broadband it,
but I just don't have the time anymore. If there is anyone else who has
fixed their VCO to lock in the 15 meter band, I would like to talk with
you about it.

Harry

The 4CX10K (which is a better tube to run on the base... Tetrodes require less drive, less input power, less overall station power consumption due to the fact that you don't need a driver, cleaner output, one less stage in line, etc., etc., etc.) with a Johnson Viking as an exciter will hold 10,000 watts all day long, for the rest of your life.

I have played with one on 220, single phase, using 100A service, dedicated. That service was used to power this amp, alone. The rest of the station shared nothing but the ground system.

This was allowing for 35Kw+++ headroom, PEP.

If you get the right mix of ferrite, it will be VERY good at those
frequencies.

However, an inductor, in series with a ceramic disk may work better.

'1975' 454 Chevy Suburban. Tan, body and paint in excellent shape. Runs great with all new black and gray interior and molded carpet (clean). Comes with 2 alternators, 1 -200 amp, external rectifier, and variable voltage regulator installed. New, never used. Also all the coax, 2 OT (I think?) power cables with disconnects already installed. Custom radio mount, I had a Galaxy Saturn mounted on it. Bitchen, custom machined, aluminum antenna mount. 9 new (never used) 6 volts heavy duty golf batteries. plug n play ready for a 16 pill. $4000.00 San Diego Ca.

>not alter that fact.
>

You insignificant fool. I do not associate with people who does not respect other users of the band. It is not the intention of ours to interfere maliciously in any way, shape or form. I feel that bandwidth that is not used by its assigned organizations above and below the CBRS allocated frequencies should be alloted to any user who so choses to use them. Its bandwidth not needed but can be and not wasted.

Increased range outside of the assigned range for CB is an issue thatcan be brought about. Reason? If you're barefooted, and a station from Texas can hear you yappin' away local talking, subsequently asked for a "short-break" (at 5-7db's on your meter) would give him the go ahead with a signal like that resembling an identical barefooted station signal 10 miles away or would you just keep on talking just in case you think he's coming in like skip? In any "putz" right mind, and if they are really nice guys, the local stations would give him the go ahead. How would you know if he's hailing from the "Long Horn"? Only if he tells you!

Increased power... why not? For a Novice, its 25-1500watts depending on frequency and type comms. Why not the same for CB? Maybe something like 100watts legal operating limit and no more. I'm game for 94 extra watts to be heard over Mexican skip. Thats all I need in this town.

>>>
>>BS at its finest!
>
>Think so? I don't see the FCC issuing any Notice Of Proposed Rule
>Making about adding any more frequencies to the CB band, or modifying
>the power limits, or authorizing the use of FM. So either you're
>wrong, or you just have a reading comprehension problem and don't
>understand a word of what Dwight posted. Which is it?
>

But they sure took away code for Techs to attain a HAM license. And what a BIG fucking stink the HAM world made of this. GEEEEZUS Christ... Just for a bunch of blips?

If the FCC can make a big change in the Radio World like that (which is really insignificant to me) what makes you think they can't make changes to the CB band?

FM usage, Power Limits, Frequency addition can all be taken care of. Am I wrong? Depends on your narrow-minded thinking as far as you're concerned.

Reading comprehension? More gibberish from former CBer's who got keyed on and went HAM so they can join the fraternity of bitching and whining about how CBers run power like its legal while I have to stay with in the specs FCC put out or I lose my license and get sent back down to the doldrums of the CBRS world and get keyed on again.

Shut up and quit the bitching. Its too damn noisy here! Fucking HAMs and their harmonics....

MC 10kW Jesus <qsl27@hotmail.com> wrote in message
news:385187DE.4A638622@hotmail.com...
.............snipped........
> If you hack and slash the microphone audio circuit in the radio
you can increase your audio band-width. But remember the person on
the receiving end is listening to your signal through a very
sharp a filter (okay some radios are crap and aren't too sharp) and
if your bandwidth is wider than the receivers' filter, the fidelity
of your Tx signal is going to be degraded. Another thing to consider
is that
some radios route the AM signal through the SSB filter so an overly
wide AM signal is also going to be more difficult to copy with a
"good" radio.
>
> MC
>
On SSB if you hack or slash the mic preamp it probably wont make
that much of a difference because the filter is going to low pass
limit your audio anyway. What will come through is the IM3
distortion created by the overdriven mic amps and/or balanced
modulator because the products of this end up in-band with your main
audio frequencies. The filter can't take out what is in it's pass
bandwidth.
On AM, the usual results of hacking the mic or mic amp is an
increased bandwidth. In fact, just overdriving the radios' speech
amp and/or modulator will increase the IM3 products which, again,
fall within the channel assignment.
I've made many a test on many different radios and find that the
usual CB will Tx a very hi fidelity if the mic can reproduce it. I'm
talking +/- 10 khz if not more. to make matters worse, if the audio
has been distorted by overdrive you can be assured the signal will
occupy a spectrum well into the next ch.'s up or down.
It seems to me that the audio used to modulate the radio would
benefit from being band-limited as soon in the process as possible.
This will ensure that the only sounds transmitted are the ones in
the most effective bandwidth. I refer to aprox. 300 hz. to about
3500 hz. and possibly extending out to 4.5 khz.

So, in an emergency situation, I would rather have that than a CB. I know that the state police in Indiana monitors or at least used to monitor ch 9. However, unless you have a good set up power/antenna wise, it will be useless. I am not a sales person, but since I live in a part of the the contry that is somewhat flat, cell phones work in most parts of the state. Someone who really wants a cell phone only for emergencies should invest in a bag phone, they are stronger signal. I am going to get an adaptor to for my handheld so I can put an antenna on my car to make sure I can get a signal almost anywhere. Your right about that tumor thing, but usually those are the people that are sales people that talk on them 24/7. Besides, cops have 800 mhz radios, most have the small shoulder mic with a small antenna. I have not heard any reports that these cause tumors---yet. Since its the same band, I am wondering if cities are keeping it hush hush so they don't have to go back to 155 or 400 mhz, or if its just reporters tring to stir up news about cell phones. Something has got to give. They (police radios/cell phones) should cause the same symptomes. Oh yea, officers usually have their radios on 8 hrs straight.

>
> Dave
> "Sandbagger"

Not really. See most of the cig suits have been found in favor of the cig company. Cell phone companies will be safe as long as the FCC says their products are safe. A couple of cig companies had some documentation that was found where they were uping the nicotine levels on purpose. Another company was found to be advertising to minors in thier inner office memos. Cell phones are different. If you one of those "Look at me, I am on a cell phone" type, no one made you use it 24/7. Besides, like i posted before. It seem strange to me how no cops have gotten these brain tumors from using 800 mhz radios which are close to cell bands. I am sure if there was a case, many cities would lose money switching back to the vhf freq, so I can see a possible "sweep it under the run" mentality. If you or anyone knows of a case please let me know. Officers have these shoulder mics with small antennas near their heads 8+ hours a day.

I do think that cell phones are the cause of some emergencies. Its kinda odd that I may use one to call in an accident which could have very well been caused by someone on a phone. I heard that Indiana is going to reprint their crash forms with the option for the officer to put "Using cell phone" as a contributing factor. This could cause many laws, etc to be passed as well as some law suits like that of the gun industry. Just my opinions,
ryan

HERE IS MY NICKEL TOSS ME 3 CENTS BACK!

You need to take some pictures of your amps.
I think your set up will win nicest looking set up but that isn't very convenient for comp use. I prefer easy access to my stuff with out digging through Plexiglas and stuff. I'm more concerned with performance over looks.

Perhaps you also remember the letter you got telling you that your call sign was being re-issued.

Seems like somebody at FCC slipped up big time. There was a protest from other nations.

The first complaint came from Cyprus over calls like 5B2056. These call signs are assigned to ships registered in that country. Other countries followed with complaints of their own.

The radio may be on, but no signal comes out unless the PTT is pressed.
My cell phone xmits whenever it's "in use". Big difference!

Yes, 3.4kHz is about the highest you ever need to go. Especially
considering that your typical CBer is a male whose voice is not going to
have much audio information above 2kHz anyway.

This was e-mailed to me from AES a few days ago....
New. And the Band is hot!
Ranger RCI-2950DX 12/10M Transceiver
An old favorite now updated with an improved receiver, double FET balanced mixer, surface mount components and improved display lighting. Operate local communications as well as frequent worldwide DX, base or mobile. Participate in club events, emergency communications and more! The unit covers 24.800-24.9900 and 28.0-29.6999MHz with an RF output of 25W on SSB and 10W on CW/AM/FM. The RCI-2950DX also features auto SWR monitor, receiver clarifier, noise blanker/ANL and programmable repeater offset. The unit has a large frequency display with dimmer and an active frequency scanner with 10 programmable frequencies. A frequency selector lockout and PA feature are also included. $249.95

Looks and acts like an RCI 2950 but the freq range when modified is
shifted slightly so you get the entire 10 and 12 meter bands,preferable
for amateurs over the spectrum the RCI provides that they can't legally
use.
Lots of quality problems with the ones I have sold compared to the
RCI.

Tested this one. It's good. The Grant XL is more selective and every bit as sensitive. Of course, the GrantXL isn't a 10/11m radidio. Someone mentioned the old Grant. I'll agree here too. I think you'll find that single conversion SSB receivers are superior to dual or triple. Once again, more isn't necessarily better.

> tubers,....who's your daddy?.....icm out.....
Next time I visit the US I'm going to take a college course in American
English as a foreign language!

When I read the mail on 6 I have to act as translator to anyone in the
shack but sometimes even I have problems.
>> http://www.linearampuk.u-net.com/
Of course we can run tubes (we call them thermionic valves) as long as
you have a ham (amateur radio) license.

We are allowed 26dBw (400w pep to you and me) with a full license. I'm
aware you can power up to 1500 on the ham bands.

More if you live in CA and operate on 75m:-)

> with
> you about it.

It is the PLL that locks, not the VCO. Sorry to split hairs here but I've designed many a PLL circuit. I'll be up front and say I've never modified an HR2510/2600 with the Chipswitch myself, but I would suspect the best way to attack this is with some kind of switched line that changes state at the low end of the band. This can be used to alter the frequency spread of the VCO. (old Motorola trick here). I'm thinking here about an additional capacitor that is pulled low through an open-collector transistor. The base of the transistor is attached to the line that changes state (I suspect there is one in there somewhere) via a 8k8 resistor. This way the capacitor is at high impedance normally and goes low. I've seen wideband radios that have two of these circuits that are switched in and out to expand the range. (2 of these give you four bands of tuning for the VCO).

Uniden has that market tied, wrapped and shipped!

Uniden does make professional two-way products, but in my opinion they are bottom-shelf compared to the likes of Ericcson, Motorola and pretty much all others.

The Short Answer:

Replace your guitar cable(s). A musical instrument cable is constructed -differently- than a regular ol' 1/4" phone patch cord. It has two conductors surrounded by a third. One is the "tip" or hot lead (center pin of plug), the next is the "ring" or ground and the third is a braided jacket surrounding them. The way the cable is wired is as follows.

Amplifier end: Red (or clear) to tip, Black and Shield to ring
Instrument end: Red (or clear) to tip, Black to ring, shield floating free <--- very important!!

Make sure that you use the cable the "right" way round. Professional cables are usually have ends marked "instrument" and "amplifier" or an arrow indicating direction. This is particularly important if you are playing live.

AM radio stations can only get into the amplifier if there is a means of rectification. What the devil does that mean? Well, there must be a non-linear junction somewhere in the path. Typically, amplifiers themselves do not have these non-linear junctions. What is happening is that your 1/4" plugs (and possibly sockets) are dirty and/or worn. These less-than-perfect connections, with invariably different types of metal, are performing the function of a diode which is rectifying the AM broadcast signal and demodulating it.

Try cleanin' 'em up and you'll be amazed.

If your running a lot of SSB, you'll need a box with bias in it. This keeps the box more linear and stable, producing less in-band splatter (IMD).

Since your running this in a big truck, i would HIGHLY suggest investing in a better antenna system instead of mega-wattage. While the increased power will surely help out your TX capabilities, a better antenna would do that AND improve your RX at the same time. This is not to mention that you'll have FAR less problems with the puter in the truck by making the system more efficient with less power. Not only can the RF play games with the puter, but the huge surges of current can also whack things up.

I have found that a strong radio and well built two pill when matched with a well tuned and grounded antenna system will devastate FAR bigger systems that are not properly installed. I have sat side by side with a two pill and keyed on a guy running a 2 x 8 box. His antenna was also physically longer and higher than mine. His set up showed much more on the wattmeter, but that didn't matter. Meters can easily be fooled. It's what's actually heard on the band that counts. Try doing more with less. It's a lot more fun and very rewarding when your killing Goliath and looking like David.

From what i can recall, the Francis base antenna was a center fed dipole much like the old Big Stick. We used to put the 8' Francis in the top of a Big Stick and ALWAYS obtained FAR better results in terms of RX and TX. You might have to slightly trim the Francis for best swr though. Sean
>

Jay wrote in message <38529577.42D55907@qnet.com>...
Hello Ripsy: No the Hot Rod" antennas are not available. I have talked with thier engineer, a few months ago.

However finding or making a bracket to put 5 Francis Amazers (one vertical, and four as ground radials) should not be a big problem. The SWR will be about 1:1.5, it will not be 1:1, but will work ok.

If we are strictly talking sensitivity, I would have to agree with MC's statement about single conversion radios. The old 858 SSB chassis had KILLER ears on them.

In terms of newer radios and sensitivity, the new Ranger board used in the RG 66's, 99's, 148 GTL DX +'s, Virage's, DX 2517's, DX 949 & 959's, etc... wins hands down.

Rejection is a whole 'nother ball of wax though..... Sean

I'm sure it will STOMP, given enough electrical system, antenna and drive.
My only concern is that it is weak on power cord. While i can't count
exactly how many are there, you would need AT LEAST sixteen 8 gauge positive
leads on that thing to do it justice. At anything less than that, i will
GUARANTEE voltage sag when under a heavy load.

Other than that, it looks like Prozac is on the air. BIGTIME !!!! Sean

If you unplug the guitar, does it go away? Try a Radio Shack
ferrite core near the amp input. Wrap as many turns through it
as possible. Maybe add the second one.

Two things to do. First is quick and easy. Have the neighbor install a .01mF cap across the contacts on the microphone/mouth end of the phone. Second is also easy but a bit time consuming. Obtain a #43 material toroid from Amidon or equivalent and using a couple feet of twisted pair phone wire, wrap at least 6 turns around the toroid creating a choke, and then in turn, splice it into the phone wiring in the wall so that it is invisible, behind the cover plate. This most certainly will take care of it.

I recommend a 102" whip or a Wilson 1000.

The radio is the source of the RF power to the antenna (unless you use an amp). The antenna must be rated to handle this load. It is best to over-rate the antenna power by a factor of 2.

However with a Wilson or a K-40 you will never be in danger of burning up the coil with your radio. The 102" whip does not have a coil and can handle more power.

>or breaking existing rules.

Then that is the result of the company you keep. Not everyone on the
band is a putz with no respect for other users of the band. The fact
that you apparently choose to associate only with people who are does
not alter that fact.

>> When Amateur Radio is added as an existing option that can meet all of
>>the demands for increased range, power, and frequencies, there is
>>absolutely no reason for the FCC to even consider a change in the
>>existing rules. Now some may not like Amateur Radio as an option, but
>>it is an option that serves the common good (even if it does not serve
>>the good of the few individuals who don't like it). Therefore, it is
>>the only option that a CB'er, unhappy with the existing Citizens Band,
>>is likely to get under the current climate towards CB'ers.
>>
>BS at its finest!

Think so? I don't see the FCC issuing any Notice Of Proposed Rule
Making about adding any more frequencies to the CB band, or modifying
the power limits, or authorizing the use of FM. So either you're
wrong, or you just have a reading comprehension problem and don't
understand a word of what Dwight posted. Which is it?

NEWSLINE 1165

Newsline report number 1165 for release on Friday, December 10th, 1999 to follow in

5-4-3-2-1.

The following is a Q-S-T. The FCC says no to five petitions to change the face of ham radio and Kids Day is on its
way. These stories and more on Newsline report number 1165 coming your way right now!

(Billboard Cart Here)

*****

FCC TO HAM PETITIONS: NO!

The FCC has turned away five petitions for rules changes including the very controversial request by the Central
States VHF Society that would have mandated protection for weak signal spectrum from users of wideband modes
like FM. Rick Lindquist , N1RL, of the ARRL Audio News has the details on this latest FCC action:

Lindquist: "The FCC has turned down five more Amateur Radio-related petitions, including three filed by the ARRL.
The FCC consolidated the dismissals into a single Order, released November 29. Among the five was a petition filed
last spring by the Central States VHF Society. That petition, designated RM-9673, generally sought more restrictive regulation of the modes used by amateurs
in the 6 meter, 2 meter, 1.25 meter and 70 cm bands.

The three ARRL petitions dismissed were RM-9259, filed April 3, 1998, asking for an FCC declaratory ruling to equate observance of voluntary band plans with "good amateur practice"; RM-9115, filed March 12, 1997, seeking to permit RACES participants and others to intercommunicate during emergencies, drills and tests and to expand the time allowed for RACES drills; and RM-9106, filed March 12, 1997, asking the FCC to permit stations in the Territory of American Samoa to transmit on 7.1 to 7.3 MHz as a domestic exception to the International Table of Frequency Allocations.

The FCC also dismissed a petition filed March 19, 1997, by James Cardillo-Lee, KE6VGV, asking for a rule change to permit hams who also are emergency personnel engaged in disaster relief to use the Amateur Service bands while on paid-duty status.

The Central States VHF Society petition, filed May 3, had expressed concern about increasing encroachment into the so-called weak-signal portions of the

bands above 50 MHz by wider-bandwidth modes, such as voice FM and packet. CSVHFS said voluntary band plans had not been successful in limiting the activity.

In turning down the petition, the FCC said that amateurs, including weak-signal adherents, already have been provided segments in the bands at issue that are off-limits to certain types of stations. The FCC reiterated language from another Report and Order that declared it was "unreasonable" to expect to operate in a totally interference-free environment. The Commission also expressed concern that "subdividing amateur service bands on the basis of operating interests would result in a loss of flexibility to accommodate changes in operating trends and emergence of new technologies." The FCC said it agreed with the ARRL's position on the CSVHFS petition that education and the application of existing rules should suffice to minimize interference among various modes.

In dismissing as "unnecessary" the League's request for a declaratory ruling to equate band plan adherence with "good amateur practice," the FCC noted that a basic amateur principle is that "all frequencies are shared, and no frequency will be assigned for the exclusive use any station." The Commission suggested it was reluctant to expand its regulatory role beyond the existing limits on the emission types that may be transmitted in different subbands. The Commission, however, did reiterate existing prohibitions against willful and malicious interference.

The FCC said the requested changes "would have the effect of transforming voluntary band plans into de facto required mandates," something inconsistent with current FCC policy.

In denying the ARRL's petition for changes in the RACES rules, the FCC said the League failed to demonstrate a separate rulemaking was warranted. The FCC noted that it's currently considering "the necessity of separate licenses for RACES stations" in another proceeding.

>I'm Rick Lindquist, N1RL.

With these matters now out of the way, there is a good chance that the F-C-C may turn its efforts to finalizing
the order to restructure the overall Amateur Radio service. A few weeks ago the ARRL reported that there could
be a release on this before years end. (FCC, ARRL)

*****

FCC TO POWER COMPANY: FIX THE PROBLEM

The FCC has told the to Pacific Gas and Electric power company that it has an obligation to fix equipment problems
that cause harmful radio interference, even if the interference is only to ham radio operators.

The case involved long-standing complaints by several northern California amateurs to Pacific Gas and Electric
Company regarding severe power line noise on the ham bands. On November 22, the FCC's Consumer Center wrote
company Vice President James K. Randolph, requesting the company act to correct the problem within what the F
C-C termed as a reasonable time.

Under Part 15 of the F-C-C's rules, utility companies and others that fall under its provisions are obliged to not
cause harmful interference to licensed services . They must also cease operating a device that's causing harmful
interference upon notification from the F-C-C.

The FCC said that its letter was intended as a reminder that the unresolved interference problem may be a
violation of its rules. Also that it has the power to levee a fine each time a rule is broken or ignored. (FCC, ARRL)

*****

FCC EXPLAINS WARNING ISSUED TO AF2Y

A follow-up to last weeks story concerning an FCC warning letter issued to Charles Schwartzbard, AF2Y, of Clifton
New Jersey. As reported, in it's November 2 nd letter to Schwartzbard, the FCC alleged that AF2Y had apparently
been operating his station in a manner that causes it to emit an unusually wide signal, one that is over-power, or
both. The letter also cautioned Schwartzbard that airing personal conflicts with other licensees on the Amateur
bands, or slander or deliberate interference to other licensees would result in the loss of his Amateur license.

To our knowledge, telling a ham that he could not air a grievance or transmit language that could potentially get
him sued for slander was a first. The reasoning became quite clear when the FCC's Riley Hollingsworth, K4ZDH,
explained on the RAIN Enforcement Log that this particular situation required some direct intervention by his office:

Riley Hollingsworth: "The letter also contained a warning concerning airing personal disputes or slander or
arguments with amateurs on the Amateur bands.

This was an extreme case. We had allegations on it for quite a while and we had been watching it.

You can have disputes on Amateur Radio, but in extreme cases where you may be instigating or slandering other
Amateurs, of coarse we do not tolerate it."

By the way, for the latest on ham radio enforcement action, direct from Riley Hollingsworth K4ZDH, take your
RealAudio equipped Internet browser over to www dot rainreport dot com. Click on the FCC Enforcement Log and
sit back and listen. (FCC, RAIN)

UK HAMS SAY YES TO INTERNET REPEATER LINKING

Hams in the United Kingdom are quickly saying yes to a British telecommunications agency idea to permit Amateur
service repeaters to be linked via the Internet. Jeramy Boot, G4NJH in Nottingham in the U-K has been following
the story and has the latest:

Boot: "Further to the report of the 7th of November concerning experimental linking of Amateur Radio to the
Internet.

The Committee of the U.K. F.M. Group - Western held a meeting on the 8th of November at which they agreed to
cooperate with such a project. The group operates eighteen repeaters in the North-West of England. It is
prepared to make its 433 MHz GB3MT voice and data repeater on Winter Hill available for such experiments subject
to Radiocommunications Authority and RSGB agreement.

>Jeramy Boot, G4NJH.

The Radio Society of Great Britain's Repeater Management Committee has also been following the recent proposal.
It says that it supports and encourages the open-minded attitude of the Radiocommunications Agency provided
that it does not introduce elements of abuse to any aspect of Amateur Radio. The committee also says that this
kind of linking could be a way of increasing activity and making amateur radio accessible to many people who might
not otherwise consider taking up the hobby. (G4NJH, RSGB)

*****

KIDS DAY

Closer to home, the first of two of the most important ham radio operating events of the new millennium takes
place on Saturday January 1, 2000. This will be the first Kids Day of the new century and it is important because
it could easily be the key that assure a crop of new and vibrant young hams will be a part of the hobby for
decades to come. Jean Wolfgang, WB3IOS, is the Educational Activities Coordinator for the American Radio Relay
League:

Wolfgang: "Even if they don't go into radio immediately, you do not know what is going to happen in five ot ten
years. And that is why I think it is so important."

It is easy to take part in Kids Day. All you have to do is open your home and station to one or more of the
children in your area. Invite them in, let them talk on the radio and exchange a Kids Day greeting.

Wolfing: "The suggested exchange is the child's name, age, location and what their favorite color is."

According to reports of past Kids Day operating events, a significant number of youngsters have become
interested in ham radio and some have even gone on to get licensed. And that's really what Kids Day is all about.

So from 1800 to 2400 U-T-C on January 1st of 2000, invite a local kid to share ham radio with you. You will both
be glad that you did.

For more information on Kids Day 2000 please see page 48 of the December 1999 issue of Q-S-T magazine. (ARRL)

*****

90th BIRTHDAY FOR FAMOUS RADIO CLUB

An institution in the world of wireless celebrated a monumental event on Monday, November, 29th. That's when
the Radio Club of America, an organization for professionals in the radio communications industry celebrated its
90th birthday.

Back in 1909, when it was founded, radio communications was very much in its infancy. The league of pioneers of
radio technology who belonged to the club over the years set many milestones in broadcasting, mobile radio and
other industry sectors.

The Radio Club of America has seen the huge explosion in radio broadcasting, then television, through to today's
enormous worldwide use of the mobile telephone. While not an Amateur Radio club per-se, many well known hams
can be found listed in its prestigious roster of members. (RCA, Q-News)

*****

FCC CREATES NEWS MEDICAL IMPLANT SERVICE

From the FCC comes word that it has established a new Medical Implant Communications Service or M-I-C-S
operating in the 402 to 405 MHz band. In rendering its decision, the FCC noted that operation of today's medical
implant devices requires that they be magnetically coupled to external programmers or readers. This requires very
close spacing between the implanted device in the patient and external control equipment, often requiring body
contact and very slow data rates that can take up to fifteen minutes for a single data transfer.

The Commission says that by creating the new Medical Implant Communications Service will permit the use of
ultra-low power radio-controlled devices such as cardiac pacemakers and defibrillators. This says the FCC will
save countless lives.

For more information go to the web at
http://www.fcc.gov/Daily_Releases/Daily_Business/1999/db991130/fcc99363.txt (CGC Communicator, FCC)

*****

SHERYL SEGAL DEPARTS AS FCC WEBMASTER

Still with FCC news, word that Sheryl Segal has left her post as FCC Webmaster, but will continue to work on
document management for the Commission. Under Segal's guidance the FCC web program has grown into a vibrant
and essential government resource that directly serves the citizens of the United States. (CGC Communicator)

DX'ER CHOD HARRIS VP2ML - SK

I'm Bill Pasternak , WA6ITF with word that the changing of the guard in ham radio continues as a name synonimous
with the world of D-Xing has fallen silent. This as the worlwide ham radio community mourns the loss of CQ
magazine DX columnist Charles J. Harris, WB2CHO.

An active contester and DXer, Harris had operated from a number of
exotic locations. It was during that time he obtained his distinctive second call of VP2ML. C-Q Editor Rich
Moseson, W2VU, had these thoughts to share about Harris' passing:

"All of us at CQ will miss Chod. He was our DX Editor for ten years. On one level, he lived a life that many hams
only dream about -- operating from exotic places like Christmas Island, the Galapagos, and of course, Monserrat,
where he lived part-time and got his VP2ML callsign. Chod devoted much of his life to ham radio, but it was a life
that was all too short. He was only 50 years old when he died this week.

Chod packed a lot of life into those 50 years, though. He started out as a schoolteacher, then went to work for
the ARRL when his doctor told him he needed a job with regular hours and less stress. At least he got the regular
hours. When he left the League in the late 1970s, Chod did a lot of operating from different places and got
involved with a variety of publishing enterprises, including a woodworking magazine, the weekly "DX Bulletin," and
"DX" magazine, which he started in 1989, then sold a few years ago.

Chod's dedication to DXing was obvious in the location of his home on a California hilltop with a good takeoff angle
over the Pacific, and even in the name of his dog -- which is Dog X-Ray."

-----.

Harris passed away on December 8th of complications resulting from a severe heart attack he'd suffered in
November. In lieu of flowers, the family has asked that donations be made to the American Heart Association or to
the Northern California DX Foundation.

I', Bill Pasternak, WA6ITF, in Los Angeles for Newsline. Tony. (CQ Magazine, ARRL, others)

*****

ANTARCTICA SATELLITE HAM RADIO EXPEDITION

Ron Ross, KE6JAB, is again on a trip to a mountain area in Dronning Maud Land, Antarctica that was scheduled to
begin this past week. Spacenews reports that this will across-country skiing and camping trip, pulling sledges from
mountain to mountain.

Similar to his last trip, Ron has with him an Amateur Satellite Radio Station. He will use it to transmit text messages and images from Antarctica back to a website in San Francisco, California. The messages will be distributed through a mailing list, and images will be posted on his website.

Ron will try to send a travel report and a new image each day. He expects his mini ham radio satellite expedition to last the entire month of December. More information about the trip is available at www.thistle.org.
(Spacenews)

*****

SA 40 METER INTRUDER WATCH

South African hams are on the lookout for pirate broadcasters and other stations that violate the Amateur Radio bands. Newsline's Mert Garlick, N6AWE, explains Intruder Four Zero:

The South African Radio League in conjunction with the International Amateur Radio Union Monitoring System is embarking on a new forty meter band monitoring program called Intruder Four Zero. Listeners are asked to log non amateur stations that are intruding between 7000 and 7100 Khz and note any information that they can.

Project Intruder Four Zero runs through the end of the year. Although the section 7 point 000 to 7 point 050 MHz is a shared band in some nations, the South African Radio League would appreciate reports of non-amateur operation. Please send your reports to Glen Duffy ZR5GD by e-mail to iarums@futurenet.co.za

-----

Again, Intruder Four Zero reports go to Glen Duffy ZR5GD by e-mail to iarums@futurenet.co.za. (SARL)

**

CANADIAN ARES MANUALS NOW IN FRENCH

Radio Amateurs of Canada has announced that two publications relating to the Canadian Amateur Radio Emergency Service are now available in French on the R-A-C web site. Both may be downloaded and read or printed at no charge and viewed using Adobe Acrobat Reader. (RAC)

*****

NEWS FROM 4X

The Israel Amateur Radio Club will remain the Israel Amateur Radio Club. Last year, some Israeli hams began a

campaign to find what they considered to be a new name that they felt was more fitting as we approach the 21St.
century. Some hams wanted the name of the club to change to Operators of Radio and Communication. The
matter was brought to a vote at the I-A-R-C executive council, where it was summarily defeated.

Also from Israel comes word that the Jewish National Fund in charge of forestation and other land improvement has
agreed to sponsor the clubs special operation for the year 2000. Their contribution will be the printing of Q-S-L
cards and certificates for the event. (Hagal International)

*****

DX

In D-X, word that Paul Blumhardt, K5RT, has been appointed CQ Worked All Zones Award Manager, effective
immediately, by Dick Ross, K2MGA. Ross is President of CQ Communications, Inc. and Publisher of CQ magazine.
Blumhardt succeeds Jim Dionne, K1MEM, who passed away in October. (CQ)

On the air, news that the 9M6AAC Hillview Gardens Resort station in Borneo is now active. For current updates
and photos, check the web page at www.qsl.net /n-2-o-o slash borneo. (DX Digest)

Also PA3GIO, reports from the Isle of Jersey that he has to use an M-J prefix instead of the G-J as first reported.
Look for him to be active as MJ/PA3GIO from December 11th to the 16th. (OPDX)

And several new D-X beacon stations make the news this week. Again Jeramy Boot, G4NJH:

Boot: "From Martin Harrison, the Region 1 High Frequency Coordinator, comes the following beacon news.

The latest beacon in the worldwide HF beacon network, RR9O, has been heard in the UK with good signals. This
beacon is located at Novosibirsk in Siberia and, like the other beacons in the network, transmits for ten seconds in
sequence on 14.10, 18.11, 21.15, 24.93 and 28.20MHz with four levels of power - 100 watts down to 100
milliwatts. The final station to complete the 18-station network, is expected on air from Hong Kong shortly.

There's also another new 10- beacon, A41RB, now in operation from Oman. It is run by the Royal Omani Amateur
Radio Society, transmits on 28.194 MHz with 10 watts to a Cushcraft AR-10 antenna, and is sited at locator
LL93FO. The power will subsequently be increased to 100 watts" (G4NJH)

More D-X news, next week.

*****

TRW SWAPMEET - ON THE MOVE CHRISTMAS DAY

And finally, guess whats happening in Southern California on Christmas Day? Yes, the kids will all be up early to
open the gifts that Santa left under the tree, but one member of the household may be missing. That's because a
very popular event will be taking place on that morning. We are talking about the famed TRW Ham Radio Swap
Meet. It takes place the last Saturday of every month and according to the T-R-W Radio Clubs' Wendell K. Young,
KE6ASC, even a change of venue and Santa Claus himself can't close down this event:

Young: "Actually the property we hold the swapmeet on changed hands in November. We did get some leeway
from the City of Manhattan Beach to hold the swapmeet there in November, but we are moving to our new location
in December.

The [swapmeet happens the last Saturday of the month and the] last Saturday of the moth happens to be
Christmas morning. we are [however] going ahead. Come rain or shine -- or holidays -- we hold it in the last
Saturday of the month."

If you are one of the tens of thousands who will be in the Los Angeles area on Christmas Day, and want to do
something completely different, then the TRW Amateur Radio Club has an invitation for you. Wendell Young,
KE6ASC, says to drop by. Its in the suburb of Redondo Beach only a short drive South from Los Angeles
International Airport:

Young: "Head south on the 405 Freeway, get off on the Rosecrans offramp heading West. Continue westbound
until you get to Aviation which is the stoplight with the train-bridge overpass. So left which is southbound to
Spacepark Drive which is one traffic light south of Marine."

The monthly TRW Swap-Meet began in 1974 hand has become one of the nations best known monthly ham radio
bargain finding events. And if you do decide to show up on Christmas Day, you can still make it home in time for
turkey and all the fixings. Wendell says that the meet starts at about 7 AM and is over around 11:30 AM Pacific
Standard Time. (Newsline)

hi,i have the following for sale.all gear is in great working condition and all radio's are tuned-up:

1 cobra 148GTL with x-tra channels in hi/low and brt/dim switches..and a 5-tone roger beep in the cb/pa position.radio sounds great and is cosmetically a 6-10 (has 2 holes were switches usd to be mounted on top case and a few scrapes here and there).$100/or $115 with cobra power mic

1 uniden grant LT with x-tra channels (no skips) in cb/pa-hi/low-brt/dim switches..6+/- open clarifier..fully modified..only used a handful of times..looks brand new with all original accesories (box,manual,etc.)$150

1 PDC-256 internal freq counter..with paperwork and box..good condition.$75 or will sell installed into either the 148 or grant upon request.

1 silver eagle desk mic looks new..works fine..have box.$50

1 cobra power mic $15 looks and works fine.

1 2-tone roger beep board nice sounding (for a roger beep) $15

i would love to sell as package or partly-packaged but will settle for seperate buyers..any questions or if you want to work anything out email me at Jayedie11@aol.com i will also do any mods or wiring that you need upon request (although most mods are already done).. prices are negotiable in package or partly packaged deals.....73's

Source record: 14797

Im very new to CBs and purhcased 2 COBRA handhelds recently. Is it as simple as replacing the standard rubber ducky antenna with a mobile antenna for additional gain? What if I install a mobile antenna on the roof of my home so I can use the handheld as sort of a base radio. I've heard of calibration stuff but is it necessary as I plan to use the radio within a 4-5 kilometer distance only. Any help is appreciated.

>If you get the right mix of ferrite, it will be VERY good at those
>frequencies.

The input impedance of the amp is going to be in the
mega ohm range. Sine the ferrite acts as a impedance in
series with the input you would need to find a ferrite
that provided a significantly higher impedance than
the input impedance of the amplifier even if the amp's
input impedance drops to 100k ohms at the AM band.

1359. THIS IS REAL CB HISTORY !!!!

Newsgroup: rec.radio.cb
Date: 1999-12-12 00:00:00 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <38540bc5@news.planetc.com>
Source record: 14808

Probably in '58 at the age of 2, someone may of put a CB microphone in my hand & told me to go to town, but I'm not sure about this part!
I went to a school mate's house in the early - mid 60's & saw his dad talking on a Tube base station. My friend had strong 100 mw walki talkies, or maybe they were 1 watt or 2. I got 100 mw walki talkies & put 2- 9 volt batteries in series for MORE power (the 1st kicker!!!) . This with longer wire antennas produced more signal than many "pill heads" do today!!! Then I tuned the receive coils to hear the 11 meter SWL band. Then made SW radio as a knight-kit and got other 100mw walki-talkies. Used hand helds in the 60's to "spy" on other kids in the 'hood after watching too much "Man from UNCLE" and Lost in Space TV programs! In '72, borrowed a base & got my 1st base--a Lafayette 924. Got out of CB in '73 because "it was getting too crowded !" Started working for a CB shop in fall '76, went to work for Hy-Gain in Neb. & AS in Cleveland in around 76' & '77, & started my own CB shop in '79. Still do it today! Only the Lord could of cause me to get into CB ! I is gettin' more fameous as time goes on! In '82 listened to cordless phones on 1700kc, before the communist law system came in that said that we could not "intercept" phone calls, but we could still RECEIVE them under the U.S. Constitution, so I got some of the "blockwatch" old ladies in trouble by passing the tapes to the cop head of it !!!! But that is cordless phones so I am off point. CB leads to other things, right Hambo's ?
Dave!!!

>non-linear junction somewhere in the path. Typically, amplifiers
themselves
>do not have these non-linear junctions.

Oh yes they do! All transistor amplifiers have great potential to rectify and demodulate AM radio. The base-emitter junction of the input amplifier is probably doing the rectification, and fitting a small 1nF disc ceramic between base and emitter may fix the problem (if you are up to delving inside the amp.

Otherwise, I would suggest trying a 1nF disc ceramic capacitor from input to ground at the plug going into the amplifier. This will shunt any RF signal picked up on the inner core of the lead to ground. I assume there is no breakthrough when the input lead is not connected

Its best to remove the Xtal filter using PIN diodes. Most radios use
this method.

Totally correct Bob.

>and why Carrier Balance control is so important.

Ok, if I follow what you are saying, (correct me if I am wrong) your feeding audio and carrier to the balanced modulator. You get both sidebands at the frequency of the RF that was fed to the balanced modulator. But the audio is being filtered out to provide a DC bias for the audio IF? That leaves you with nothing, The balanced modulator removed the RF (a major portion) now you filter out the audio? The steady carrier you refer to is about 30 dB down from what was inserted.

>
>Carrier Balance? AM Power? Well, I'm not trying to derail the whole

>drive is set by the NPN/PNP AM regulator section using DC bias for
>linear operation for Audio with a DC component applied while in AM.

You won't have any carrier being fed to the latter stages unless you unbalance the balanced modulator. What kind of AM would you have if you didn't unbalance the balanced modulator? DSB unless it was fed to a filter.

>
>[If you offset the carrier balance in AM, you'll find yourself with a

>this on your pride and joy HiPo miracle of a radio - you'll sound, as
>well as hear, a lot of noise from people yelling at you...]

Where would you get phase modulation from? Playing with the carrier balance would only change the carrier level.

>
>The typical AM portion of the radio [read:AM regulated CB AM/SSB

>counterparts, but are directly driven by the Mod AMP transistor into
>the respective Collectors of the Driver and Final pair.

Where is the carrier (or RF) being generated? How is it being fed to
the drivers and finals? Read Bob C. 's post. He's very accurate on
how its done.

I ran my 32 pill on one 250 amp leece today with an m400 se driving it in my buddies car (#7). Needless to say there was some major voltage drops but it was pegging the shit out of a dosy 400 watt meter. His 16 pill almost does the same thing but not a full peg like the 32 pill. This tells my he is driving the 16 pill and still has current to spare.....

If you were on the bowl you probably heard it since the BYU was coming back to us for over an hour..

Thats the only type of meter I would use. I can hold around 1800/2000 with a 200 amp leece holding 16 volts and at the very least around 2400/2500 with 1-250 amp alt on the 16 pill alone, the peak watts are there as well. I don't see where this is a outragous claim I didnt say i was holding 750 with a 2 pill or anything like that. 250 amps x 18 volts= 4500watts @ 55% eff = 2475 watts I may be on the low side with 55% . And you are not even taking into account the battery power. Thats what happens when you have an amp that is fairly effiecient.

In some cases you are right, But I never have any problem getting to any of
my stuff. I have already done it without the looks in the past, everything
was exposed, that got boring. I get performance and looks all in one
package.
Yes it was a challenge to make it functional but it was never boring.

When I volt up and watts go down? Sorry I have never experianced that. The alt is only capable of producing so many watts. Whether it be on a 16 or a 8 pill etc. I can take the same alt an run a 8 pill on it at 20/21 volts I will see close to the same watts as a 16 pill on the same alt at 15/16 volts.

>
> Guess your right.... You don't see any harmonics.

That's funny, I have never seen a guitar cable like this. Sounds more
like a microphone cable.

<snip>

> Make sure that you use the cable the "right" way round. Professional cables
> are usually have ends marked "instrument" and "amplifier" or an arrow
> indicating direction. This is particularly important if you are playing
> live.

Have never seen this either. Sounds like the left handed drafting pencils
we sold freshmen in high school drafting class. An instrument cable is
just a
shielded cable. No "polarity". It's a piece of wire. That's it.
>

How about the pickups. Those big beautiful coils will pick up everything
from TV to flourescent lights. Do you have all single coils? Have you
tried a guitar with a humbucker? Your pickups may be crappy (no offense,
most stock pickups are, if yours are stock they may be.) Have you tried a
friends guitar?
I believe you said you also have tube amps that don't do this. Amen for
tube amps. I'd stick with those. Also check your grounds in your guitar
wiring and in your amp. If a ground is oxidized or has become
disconnected, noise will result. If your amp has effects loop jacks, they
may be dirty or not closing, as well as your input and headphone jacks.
The best advice I've seen is to call the station. Don't complain, just
ask. Most engineers will be more than happy to help you.

Digital Bird reading meters,
Yes! They are here and now ready to order!!
Each unit is hand-built by the "Master" himself,
This is one item that you will not see duplicated by the copycats.

This is one TRICK item. With this you can read forward , reflect and SWR readings. It has a protective alarm built-in to protect you from exceeding the highest SWR that you have programmed, plus, each one is programmed with a personal ID # to prevent up-grades or repairs by unauthorized persons. Man this thing is FAST! No more slow reading analog meters and counting all of those little lines to see your watts! Digital reading is instant and clear! This can be used in your home or "Your Long-nose Suburban" and is capable of reading from 1/8 to 100.000 bird, RMS or peak! Call now to place your order!
==========
Of course its a davemade coming soon pics to follow. http://members.aol.com/davemade1

I like the idea and the mode plus its easy to add CW to an AM rig.The problem for me is it's not legal!

Will my O2A & 858 CB's make it to Jan. 1st ? Or will my VFO go off lock then?

Will I have to get my synthesized units back out to key down in a Geek destroyed world?

IF dem idiots declare marshall law, we can use CB to get our republic back!

Will da Hambo's be with US or da un ?

Dave!!!!!!!

Kinda makes you wonder why it isn't happening these days anymore. Was this after 11m became a Citizen's Band by chance? :(

I give the petition an A+ for trying but I think this one will not find
much serious consideration in Washington except to ask why DX on 27 MHz
when 28 MHz Ham is available? Too many complaints about High Power &
Interference have almost doomed the personal radio hobbies.

1401. davemade damn.....

It's not a very efficient antenna. There are others on the market that cost less or about the same and will do a better job. You're on the net, with a little investigation you'll find a better antenna system.

Okay Jim... Lets put things into perspective. If you wish to point fingers like an irrational child. I'll play you're game, though, I will keep it rational and only play this once. My turn.

[Fellow] I was thinking about wrapping a set of Christmas lights around the
[Fellow] Antron 99. Would this have any effect on SWR at all?
[Fellow] Thanks

[Me] Probably... If not yes.....

[You] I can't believe this post has been here since 1:30 and the best reply is a
[You] "probably". This isn't the group I remember.

Now. I did not have all the time in the world to give a lengthy reply to this fellow. So, I answered the question without a lecture on VSWR and propagation. See, I did at least reply, which, there are only a few that do, and answer questions PROPERLY. I gave the proper answer.

Again:

Will Christmas lights affect my VSWR, my answer, YES. Read beyond the probably.

You want to go on and talk how it is people like me who make those who contribute run away. Got a question for you then Jim.. Where have YOU contributed? What are the specifications on the uPD861? Oops, I answered that already. How do you disable the SoundTracking on the ST Cobra line so that you can perform the "swing" kit. Oops, I already answered that one too.

Seems to me, you are the only one "crying" or shedding tears around here. As you can see by the date and time stamp of my email, you will see it is BEFORE you replied on the newsgroup with:

[You] No offense taken.....Hey, I saw the grin! Gee, and I thought you had a
[You] sense of humor too?

If you take notice then, I left it at THAT. I did not feel compelled to "get the last word in" such as you have done below with your post.

As far as a debate..... Im through with this, and if you stay awhile, Im sure you will see that your below statement is in error. Because my friend, I DO contribute. Oh, putting you in my "filter" is not a solution my friend, in that case I would be taking orders from you, but it doesn't work like that. I appreciate your SUGGESTION, but I would rather now just laugh at any other posts you have to offer the newsgroup. I wont even go on about

the "spamming" of ham gear someone keeps trying to pilfer off. Take care.

Get a copy of Code Quick. It's a set of tapes that teaches you code by sound association. I used it and learned the code in 3 days. Then goto www.qrz.com and download supermorse and use it to practice with. I did that for 2 weeks and went to take my novice and tech exam and planned on taking the 5 wpm code exam but after hearing the 20 wpm exam decided to try the 13 and I passed it. Went a month later and took the General theory, 1 month later took the Advanced theory and passed the Extra class 20 wpm code test. Code Quick is the way to go.

73 and good luck,

Hey man I will get the amps up on the site eventually, I borrowed the camera and took a $h!tload of pics, amps included and did not like the amp pics, as I said before I know very little about the webpage building hobby and HTML but I am learning because I believe that if you are going to put up a site and advertise it, you ought to keep it up to snuff, which I would like to do on my own. I will have my camera here real shortly, I decided to go with a good camera and I had to wait till after the holidays to afford it, I then will add amp pics, step by step alternator installs, and some other projects for people to view and hopefully use to their advantage, With the camera I am looking at I will be able to take real clear close up shots..... in time...

It's called a 'quick disconnect' PL-259 plug. They can STILL be ordered thru the FIRESTICK antenna company. Yes, you just press then onto your SO-239 plug. No more screwing/unscrewing.

|>to us for over an hour..
|
|Heh Heh...
|
|Hey, where can I get a decoder ring? I want to play! :-)
|
|Specifically, what is a "pill", and what does the number signify?

"Pill's" - RF Transistor commonly found in linear amplifiers. They are
usually white and
look like pills that you would get from your pharmacy (if your
a horse that is).

|
|And what's a "leece"?

Leece-Neville - Most popular alternator used in vehicles which run a lot of
power (as in
watts) on the CB. Ranges from 200 - 350 Amps
(common sizes) in
short and big case/block (term used in my area)

Contrary to popular belief, not all CBers are knuckle
dragging morons; a few do care about the quality of their
signals, and some do endeavor to avoid interference problems.

The ARRL publications (such as the Handbook) are excellent
reference sources for people in a wide variety of radio
related disciplines.

Boy oh, boy... Wildfag just don't know how to keep his mouth shut, Number fucking one, asshole... I wasn't even this newsgroup any longer, seeing my shop is now closed on the internet, so, I figure, no sense in reading this newsgroup, but then a freind of mine e-mails me and tells me you're out there running your dick sucker again, Man, look... I'm not fucking with you anymore, I've moved on to bigger and better things, will you please return me the favor, I am NOT rfradioman@aol.com or any one else... I read the thread in here, someone's trying to start shit between us again... and I'd prefer it just drop... I got a life, I'm working alot of hours driving truck and the last thing I need right now is a another newsgroup battle.... ok?

so, let the shit drop! Please!

Thanks.

The cable between the guitar and the amp is most likely acting as an antenna, with the inductive reactance of the pickup in the guitar. The input ciruit if tube type or solid state is acting like a detector for the signal. If for example, the pickup is a 47kohm device, try putting a ceramic cap accross the input of the amp. This must be done on the inside on the terminals of the input jack for each input. I would try a cap value of 100 pF (picoFarid) / 200 Volt rated. The voltage rating can be much higher if desired. These commonly come rated at 1 kV average or higher. This cap is wired from the hot-side or tip of the jack to the signal ground.

You can try a higher value if you want to experiment. I would than by an assortment of these starting from about 80pF up to about 470Pf to try. When you have one that works great, then just do the same for all the other inputs.

Increasing this value too much will result in a loss of high frequency responce. If the value is small enough, it should not have any hearable effect at audio frequencies. It is an easy way to bypass the high frequencies to ground that are comming in along the interconnect wire. The best is to experiment with this. The idea is to try to bypass any frequency to ground that is above 100kHz or so.

Message-ID: <831ejuouv1@nntp6.atl.mindspring.net>
Source record: 14887

Siltronix 1011B, good condition with new tubes including a N.O.S. in it's original box Amperex
high output 6LF6. Comes with mic, manual, and schematics.

The "B" model is better than the "C" and "D" in that it has more coverage on the band selector, the
switch has (5) bands CB, 28.000, 28.500, 29.000, 29.200 Mhz. The output of this transceiver is
approximately 150 watts with the new final tube and tremendous audio that none of the solid state
CB's can touch.

It also has the reasonably priced 6LF6 opposed to the $85.00 8950 tube as the final.
I am asking a firm $150.00 or a trade such as a tube linear amplifier with an output of approx. 300
watts. Let me know what you have. Buyer pays shipping from Connecticut.

Thanks,
Kevin

If it is biased up, as it should be, it is hardly non-linear. Sorry to be a wanker here.

> Otherwise, I would suggest trying a 1nF disc ceramic capacitor from
> input to ground at the plug going into the amplifier. This will shunt
> any RF signal picked up on the inner core of the lead to ground. I

I wouldn't do this myself. This will load down the input stage more and could introduce other problems as the input to a guitar amplifier is (read: should be) very hi-Z. And besides, everyone knows all the -best- guitar amplifiers don't use transistors. :->

XLR (balanced) type mics use this also but in their case the shield is not common with either conductor. Similar principle though.

> Have never seen this either. Sounds like the left handed drafting pencils
> we sold freshmen in high school drafting class. An instrument cable is
> just a
> shielded cable. No "polarity". It's a piece of wire. That's it.

Hee hee! I know what you're saying/thinking. There is a definite benefit to grounding at the amplifier end only. Some fellas use the type of connector on the patch cable (barrel vs. flat) to indicate which way round it goes.

> How about the pickups. Those big beautiful coils will pick up everything
> from TV to flourescent lights. Do you have all single coils? Have you
> tried a guitar with a humbucker? Your pickups may be crappy (no offense,
> most stock pickups are, if yours are stock they may be.) Have you tried a
> friends guitar?

I don't believe the pickups are aggravating the poster's problem. It is probably the non-linear junctions on the plugs/sockets. You can have all the wire in the world and it won't be a radio receiver unless you've a means to demodulate it - and that calls for a nonlinearity. There's nothing inherently non-linear about a coil of wire, a cable or the wires inside a guitar.

> I believe you said you also have tube amps that don't do this. Amen for

This is one item that you will not see duplicated by the copycats.

This is one TRICK item. With this you can read forward , reflect and SWR readings. It has a protective alarm built-in to protect you from exceeding the highest SWR that you have programmed, plus, each one is programmed with a personal ID # to prevent up-grades or repairs by unauthorized persons. Man this thing is FAST! No more slow reading analog meters and counting all of those little lines to see your watts! Digital reading is instant and clear! This can be used in your home or "Your Long-nose Suburban" and is capable of reading from 1/8 to 100.000 bird, RMS or peak! Call now to place your order!

Your radios don't know what year it is, so there is no reason for them
to glitch unless you drop them on concrete. As for marshall law, those
idiots will only declare marshall law if you idiots behave as if you
need it, so take a deep breath and relax.

>wanker here.

Well, it depends what you mean by non-linear.(sorry to be a pedant too).
There is no such thing as a perfectly linear amplifier - all amplifiers have
some non-linearity, and musical instrument amplifiers are certainly no
exception. Also, an amplifier which is quite linear at audio is not
necessarily so linear at 1MHz. Say the amp is picking up one volt of RF from
the radio station. Say the amp produces 0.1% distortion at that frequency.
That's 60dB down, or 1millivolt of audio - quite enough to make plenty of
noise from a high sensitivity input!

Believe me, if you have a really high AM field strength the level of the RF
signal itself will drive the input stage into serious non-linearity by
simply overloading it.
>
besides, everyone knows all the -best- guitar
>amplifiers don't use transistors. :->

You're right about transistors, of course. Horrible things, should never
have been invented. They rectify RF, for a start!

Best wishes

Norman

1454. FS: HR 2510 Plus Power Supply

This radio was purchased in December 1997, and it as been used as a base radio it as never been mobile. It as been chipswitched and it also as a channel guard filter installed. I will also throw in a 13.8VDC 14 AMP power supply with the sell of this radio. I am asking $200.00 US and the buyer pays shipping.
If interested or need more details please feel free to e-mail me.
Thanks

1455. Ant. Connector Help / Here's an Odd One!

Newsgroup: rec.radio.cb
Date: 1999-12-13 00:00:00 UTC
From: John Frantz <shittohell@hotmail.com>
Message-ID: <831rk1$e54$1@nnrp1.deja.com>
Source record: 14904

The husband of a family friend died a few years back. He collected CB's, Ham's, antennas, and the like, since the early 50's. I was fortunate enough to be allowed by his widow to root through his radio equipment.
While I was rooting I found an antenna connetor that I was told (by numerous sources) never existed. The connector I found may very well date back as far as the 50's, but as I can no longer ask the previous owner where he found it, I am pretty much well "in the dark" as to its origins.

The connector changes a PL-259 screw-on connector to a PL-259 push-on connector. Anther way to put it is you screw your antenna lead onto one end, and push the other end onto the back of your radio.
It has two distinct markings on it - on the side just above the SO-239 threads. One side reads, " SO-239 BM ". On the opposing side it reads, " AVA ".

I would like to find another. This one is still functional but pretty much well worn out.

Any help is appreciated, however minor it may be.

Fella, for what it's worth, please heed this advice. Sell the 122 and get a SuperStar 3900. You'll have all your channels, a much better taking radio, and only a few more $ than you'll have in that 122 after adding channels, and 122's are very low performers.

<<Well, it is treated as a "hobby' to certain extent, what do you think about the Petition, and have you read it?>>

Very well written and thoughtfully put together. But it neglects to take into account that the CB service is not now and has not ever been officially recognized as a "hobby" service. That is the big hurdle that the FCC will probably never leap. Its position has always been that CB was designed for license-free, short range utility communications, and that amateur radio is designed for worldwide hobby communications.

I put my antenna up and try to keep it as far from my head
as I can. Sometimes I can feel the energy. I cut those calls
short. 845MHz is a lot different from 27.2MHz. I have never
felt anything from a CB antenna of mine. I also don't run
1000 watts or more. The antenna is a lot farther away from
your head than with a handheld phone/radio.

I believe that CW was, and is, legal on the Citizens Band under FCC part 15. Output is limited to 100mw and there is a limit on the antenna length. Some of the Rat Shack walkie-talkies have a provision for tone modulated cw.

I ran my 32 pill on one 250 amp leece today with an m400 se driving it in my buddies car (#7). Needless to say there was some major voltage drops but it was pegging the shit out of a dosy 400 watt meter. His 16 pill almost does the same thing but not a full peg like the 32 pill. This tells my he is driving the 16 pill and still has current to spare.....

If you were on the bowl you probably heard it since the BYU was coming back to us for over an hour..

I think that anyone with experience knows that it is all in the complete system setup and installation and not just the amplifier used.

I have some locals that will only use X-Force, some that will only use Dave, some for Pirate, some for Foxie, some Dominators and some for Texas. They all have the potential to walk tall, but some are more consistent and stable than others.

If you want to see if your box is stable, try the following simple test. Drop the carrier level down on your box and check your swr BETWEEN the amp and the antenna. This means that you need a meter BEHIND the amp and a radio's swr meter will not work. Then crank the carrier up and re-check it. If it skyrocket's either way, your box is probably unstable and oscillating.

Most "competition" amps will go berserk at low drive levels. I need not mention any names, but some are WAY worse than others. The boxes that require TONS of drive are typically the worst offenders. Sean

Digital Bird reading meters,
Yes! They are here and now ready to order!!
Each unit is hand-built by the "Master" himself,
This is one item that you will not see duplicated by the copycats.

This is one TRICK item. With this you can read forward , reflect and SWR
readings. It has a protective alarm built-in to protect you from exceeding
the highest SWR that you have programmed, plus, each one is programmed with
a personal ID # to prevent up-grades or repairs by unauthorized persons. Man
this thing is FAST! No more slow reading analog meters and counting all of
those little lines to see your watts! Digital reading is instant and clear!
This can be used in your home or "Your Long-nose Suburban" and is capable of
reading from 1/8 to 100.000 bird, RMS or peak! Call now to place your order!

After thinking about it, your probably right. While your math is correct, I assumed that you were running a driver, radio and the vehicle off of that 250 amps or so. I didn't know that you were talking about having that one alternator dedicated to just the big box.

Your efficiency percentage is probably low too though, as we are talking Class C, not A or AB. I would also have to assume that your hitting the 16 pill pretty good to see those numbers. Sean
>

PowerStation <8675309@aol.com> wrote in message ...
Thats the only type of meter I would use. I can hold around 1800/2000 with a 200 amp leece holding 16 volts and at the very least around 2400/2500 with 1-250 amp alt on the 16 pill alone, the peak watts are there as well. I don't see where this is a outragous claim I didnt say i was holding 750 with a 2 pill or anything like that. 250 amps x 18 volts= 4500watts @ 55% eff = 2475 watts I may be on the low side with 55% . And you are not even taking into account the battery power. Thats what happens when you have an amp that is fairly effiecient.

1479. Re: TVI filters work for cable?

Newsgroup: rec.radio.cb
Date: 1999-12-13 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <a5154.1982$Z63.143925@news.corecomm.net>
Source record: 14928

Gary, this is not to mention that the TVI filter mentioned typically
increases the swr / whacks up the impedance seen by the radio. This can
actually cause the radio to produce greater amounts of out of band
emissions, making even more TVI / interference problems.

Just a side note here. ALL tvi / low pass filters HAVE to be earth grounded
to work correctly. The only filter that i have seen that will work without
grounding it is the CPI, which was an absorption type filter and different
than any other made. A good idea is to install your station following
guidelines as published in the ARRL handbook. This will minimize problems
to begin with. Sean
>

Gary Danaher wrote in message <385181F5.A4148A6B@flash.net>...
The television coax is supposed to be a sealed system. No rf gets out
and no rf gets in. By putting a pass filter in the coax line, you will
accomplish nothing if the coax was installed correctly. More likely, you
are seeing fundamental front end overload, meaning that that your rf
signal is getting into the TV directly through the case, or secondly,
that the rf is coming in on the electrical line. I presume that you are
operating an unmodified radio with legal power and that it is grounded
properly? For starters, you need to see what can be done in your own
home to clean up the tv reception. For the stereo speakers, modify the
length of the wires running to the speakers, and it should improve the
situation because the wire will no longer be resonant on that frequency.

About once every 5 years I grab an updated copy of the ARRL
Handbook. It's now grown to something like 1000 pages and is
reat source covering a wide variety of electrical and electronic
information.

It also includes a chapter on radio interference, with the
notion that amateur radio operators have bpth a legal and a
moral obligaion NOT to interfere with other services, and
instructs radio amateurs to assist in the elimination of
interference problems, even if it is not their fault.

>
The LA 900 is the same unit that used to be called TX 800. The Input drive is
6 watts or less. The max current draw is around 70 amps. The LED that says
heat comes on if the amp reaches 175 degrees or hotter, lets you know to let it
have a breather.

Sec. 95.412 (CB Rule 12) What communications may be transmitted?

(b) You may use your CB station to transmit a tone signal only when
the signal is used to make contact or to continue communications.
(Examples of circuits using these signals are tone operated squelch
and selective calling circuits.) If the signal is an audible tone, it
must last no longer than 15 seconds at one time. If the signal
is a subaudible tone, it may be transmitted continuously only as long
as you are talking.

and...

Sec. 95.631 Emission types.

(c) A CB transmitter may transmit only emission types A1D, H1D, J1D,
R1D, A3E, H3E, J3E, R3E. A non-voice emission is limited to selective
calling or tone-operated squelch tones to establish or continue voice
communications. See Sec. 95.412 (b) and (c).

Makes no reference to CW or part 15.

Source record: 14941

Let me try to explain the whole thing. My friend has a Lincoln town car with a stock electrical system for his m400se and a leece 250 with the two 8 volt batteries for his 16 pill. He has two coils on the car These two coils are tuned with an mfj meter every time we park some where for keying purposes. Many times we get the meter to say 50 ohm at very low swr. My friends coax is belden 9913F same coax I use. With Teflon insolated pl259's.

We replaced his 16 pill with my 32 pill and on his dosy 4000 watt meter it dead keyed over 3000 RMS. He have a voltage meter in line that is pretty accurate since I calibrated it with a scope. The 3000 watt carrier dropped the system from 18 volts to 16 volts. @ this point we backed the dead key to about 1500 - 2000 and let it peg the 4000 meter with modulation. He kept the rpms up and the voltage meter fluctuated a volt or two..

This voltage drop does not happen with his 16 pill. and the dosy meter is just a few watts from being pegged like my 32 pill did.

I repair guitar amplifiers as a full time job, and I'm also an ex broadcast engineer, so I might be able to help. I'm familiar with most of the amps on the market today and their shortcomings. Tell me the make and model of your amp and I might be able to provide more detailed info.

Most mass-produced guitar amps today are loaded with poorly soldered joints. I've seen these detect RF in the AM broadcast band on multiple occasions. One reason why AM BCB interference is most common is because the op-amps and transistors used in most solid state guitar amps have a reasonable amount of gain in the 1MHz range.

With all due respect to MC 10kW Jesus, most guitar cables are unbalanced, with a single conductor plus shield.

You won't find part 15 regulations under part 95. Part 15 deals with low power devices such as unlicensed transmitters on the AM or FM broadcast bands and 100 mw walkie-talkies on 27 Mhz as well as "unintentional radiators" such as receiver oscillators and industrial equipment.

There are several "license free" bands covered by part 15 including the 530 to 1605 Khz AM broadcast band, 27 Mhz for walkie-talkies and remote control, 46 and 49 Mhz for cordless phones, and the 900 Mhz cordless phone frequencies.

This base works very good, it has AM, USB, LSB. SWR meter, and
modulation meter, it transmits and receives %100. it`s missing a chrome
rectangle type thing on top (just cosmetic) but thats not a big deal.
It comes with a stock mic. This base was probably built back in the
80`s, this thing is built like a tank !, weighs at least 10 lbs.
They just don`t make them like this anymore.

It looks very good, and works great !
The price is $100.00 + $12.50 for shipping, if you want postal insurance
on it, that will be $2.00 more.
Sorry no C.O.D.`s or personal checks.
a U.S. Postal money order will work.

If your interested, please contact me at;
max_it_out@webtv.net
sincerely

Helly Tony: I fixed a Pres Washington once, with no audio AM transmitt modulation. Found the main modulation pass transistor bad. Radio Shack had a replacement. Its the transistor that the audio drives for AM, and has the 12 volts goinbg thru it for AN only. Give this a try.

1515. FS: 250W Amp w/ RCI2950 and Antenna

Newsgroup: rec.radio.cb
Date: 1999-12-13 00:00:00 UTC
From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Message-ID: <834037gvn1@campus3.mtu.edu>
Source record: 14964
Cross-posted to: rec.radio.cb,alt.ham-radio.marketplace,rec.radio.swap

I've got the following equipment up for sale:

1 - RCI 2950 10-meter radio w/ 11-meter modifications
1 - 25W->250W linear amplifier, 3 settings, with receive preamp
2 - 1000W capable "penetrator" style antennas (one tuned at 29Mhz,
one tuned at 27.500 Mhz, easily retuned) magnetic mount.
1 - 6 ft. Length RG-8 Coaxial cable between amp/radio
2 - RCI-2950 style power cords.
1 - Astatic Road Devil power microphone with RCI connector.

A nice mobile station to be had, or maybe even a base with a little
work. Everything works really well. I'd like $400 for the setup.

For those unfamiliar with the RCI-2950 radio:

25W all mode (AM/FM/USB/LSB/CW) radio. With modification it
will transmit from 26-32Mhz continuously. Has features of most
10-meter only rigs, with a few extras like a roger beep, splits,
memories, and channel or frequency display.

There are many other modifications for this rig, and it is quite
commonly available on the net or from Amateur Radio dealers.

Please respond to cwbuckle@mtu.edu

Man Sean! Dennis did some numbahs to that box! Geeez... My DX3200 only
saw 1600-1800 BIRD RMS at 15vdc. Well, I guess I'm satisfied with that
though. No need to send the box to the pump and burn-up later.

Another thing, 625? Get a Bird. Sometimes those PEAK Reading meters don't
usually read accurately (even in RMS). Thats why I junked my DOSY and got
the BIRD. But then again, each to his own. My couple of Abes...

137... back out!!!

1525. Re: RF Interference Problem

Newsgroup: rec.radio.cb
Date: 1999-12-13 00:00:00 UTC
From: Dave Donoho <dave@dcs.umd.edu>
Message-ID: <3855B11A.647D4F13@dcs.umd.edu>
Source record: 14974
Cross-posted to: alt.radio.pirate,rec.audio.tech,rec.radio.cb

Correction...

I had said the AM interference was audible regardless of whether the guitar cable was plugged in... I goofed. It only happens when the guitar cable IS plugged in. Sorry! But I HAVE tried different cables (plus all of the cables work fine with my other amps), so I'm pretty confident it isn't a cable problem.

According to the majority of the advice I've gotten, I should use a capacitor somewhere near the input to bypass the RF to ground. My next question is should I use the bypass capacitor on a transistor/op-amp in input section, or should I use it on the input jacks themselves. The latter seems easier (especially since I don't have a schematic), however I read in the amp's owner's manual that the main instrument input is able to "sense" either a magnetic or piezo pickup (i.e. instead of requiring separate inputs). If I use a bypass capacitor on this input, am I going to throw off the input's "sensing" ability?

Also, the amp has an XLR jack/input for a mic in addition to the instrument jacks. Can/should I use a bypass capacitor on the XLR jack? (Although I'll say the AM interference when using just a mic in the XLR jack is minimal compared to when plugging something into any of the instrument jacks).

Thanks again to all for the help so far.

Dave

IF (big if) the radio is tuned up and putting out a good
clean/solid signal, it's value approaches $300 (IMHO).

The real value of such a radio is that If I bought it from
him at his asking price ($300), and turned around a year
later to sell it and only got the $200 - 225 you say it is
worth, I'd still be better of than if I bought a $300 11 meter
only base. What I am getting at is the value of this radio
is pretty much fully depreciated, this radio will hold this
value into the near-term future.

Sean, I have seen this as well, if you ever see this on an amp that is
biased with any voltage on the base of the transistors, that's when you
really worry, it seems to me that on some of the amps the reason it does
this is because there is not enough voltage present on the base of the
transistors for them to fully function, in some cases it is like not all of
the transistors were "keyed up". I have seen people attempt to fix this
problem by redoing the keying circuit so it required more key to pull in the
relay, therefor applying more RF voltage on the base of the transistors at
the time of the relay making, They simply hid the problem instead of fixing
it. Also a lot of the guys that repair these amps don't have a scope, or the
scope they use does not read very high, say 20 or 40 MHz. My scope is
275MHZ, combine that with a spec analyzer and it is hard "hide" a
oscillation problem.

>Ham is right next door. Martin N5PZJ

Why not, Martin N5PZJ? Why can't the FCC change the rules and make 27 MHZ a Worldwide Communication Band? Like I said before, they sure as hell can take away CODE to attain a lesser form of a HAM Ticket. Now wouldn't that be a major change that old timer HAMs tried to stop?

HAMs, you too Martin, are so narrow-minded and set in your ways that there is no more room for change. Let loose a little and relax your shoulders. Otherwise, strain your muscles and keep the tension within because no matter how hard you try, no matter what rules are going to be made (or lobbied) by you HAM's for CB'ers, the problem will never go away. For every one CB'er busted for running more than 4 watts on AM and 12 watts on SSB, there is 5-10 newbies to take their place. Learn it, live it, deal with it! Fact of life.

I'm done. I'm never coming back to this thread.

If I'm not badly mistaken, Ham rigs have been using that scheme
for many, many years. I figure these circuits came around about the
time when small signal diodes became mass produced in repeatable
quantities.

> >
I think I need to disagree with you Jim.
The average CB is using +/- 3 to 6 khz. if everything is clean.
Much more if there's an overdriven stage or an poorly designed amp.
(Hi IMD)
Nowadays, the trend is to migrate towards 2.5 khz deviation in
commercial service. Most new systems installed today are using
narrowband FM of the 2.5 khz variety.
Anymore, you can have just as many or maybe more FM systems
running in the same space as the AM rigs.

It appears you are using Outlook Express.... Do this from Outlook Express:

Tools
|
|
Options
|
|
"Send" Tab
|
|
"Settings" beside "Plain Text" under "News sending format"
|
|
"Automatically wrap text at ###" Try to set it from 70-76

Thats about it... that is IF you are using Outlook Express v.4.72.31 +

Take care.

Hank

My 32 pill means it has 32 2sc2879 transistors made by Toshiba.

The driver transistors can also be called pills witch often causes confusion to the newbie.
Example: a 5 Pill does not have 5 2879's it has a 2290 driver and 4 2879's..

You will find that it is easier to say you have a five pill then to say you have an amp with one 2sc2290 transistor driving four 2sc2879 transistors made by Toshiba.

Like when you say you drive a car you don't say you drive a vehicle driven buy a motor that generates power by internal combustion that forces the pistons to go up and down spinning the crankshaft hooded up to a torque converter going in to the transmission that is properly geared to turn the drive shaft that works the rear differential causing the back tires to spin at the same time if you have a possi rear.

Radio Shack still sells one. Works OK, but not great.

As to manufacturers, there's Avanti, Antenna Specialist, and I think
even Larson makes one.

AS has a line they make for Police vehicles. Both single band
and multi-band. They are VERY discrete antennas, right down
to using the same manufacturers mounting nuts externally to hide
the fact that the antenna is a 'custom' so you can't spot an
undercover car by the antenna. But they are not cheap.

Thanks for offering to help and thanks to everyone else for their
suggestions--I never thought I'd get so many responses! I'll make sure
I post the results of my attempt at fixing this thing.

Anyway, the amp is a "California Blonde," made by SWR. I believe it was
made in '96 or '97--I picked it up second hand last year. The AM
interference is audible regardless of whether I plug in a guitar cable.

A Southern Christmas

Twas the night before Christmas,
and all through the shack,
not a thing was a movin',
from the front to the back,

The kids were in bed,
I believe we had nine,
The wife in her curlers,
was lookin' real fine.

A cold wind was blowin',
up the holler it moaned,
All seven dogs on the porch
howled and groaned.

The boys were all dreamin'
of weapons and guns,
for killin' God's creatures,
there's no better fun.

The girls in their feminine
dreams were attuned,
to getting those gallons
of Wal-Mart perfume.

The wife wanted jewelry,
like rings with big rocks,
I wanted my Chevy,
down off the blocks.

Then in the yard,
such a noise did commence,
like something was caught,
in the barb-wire fence.

I ran to the window,
and saw pretty quick,
the man makin' the racket,
was Good Ol' St. Nick.

You may think of Santa,
in your own mind's eye,
dressed in a red and white suit,
But I've got a surprise.

That old boy's an Arkie,
our fair state he won't fail'er,
He married his cousin,
and they live in a trailer.

On Christmas, of course,
a sleigh for his rig,
He hooks the thing up,
to a razorback pig.

He climbed on the roof,
with his bag full of goodies,
He backed down the fireplace,
all dirty and sooty.

Fat legs in his britches,
chubby hands in his mittens,
I admit from the back,
he looked like Bill Clinton.

He turned toward the tree,
His eyes all aglow,
He was a Southern boy,
from his head to his toe.

His neck was a red one,
His shirt said "Light Beer",
there was no red hat,
his cap read,"John Deere".

He left all the presents,
with an air of delight,
Then it was back to the chimney,
and into the night.

He ran into the yard,
and threw his bag in the sleigh,
Then he yelled at the dogs,
to get out of the way.

And I heard him exclaim,
as those pigs took to flight,
Merry Christmas to all,
and to all a good night.....
or maybe it was a "bud lite"

It has come to our attention that a few copies of
the Texas
Edition of Windows 98 may have accidentally been
shipped
outside of Texas.

If you have one of the Texas Editions you may
need some help
understanding the commands.

The Texas Edition may be recognized by looking at
the opening
screen.

It reads WINDERS98 with a background picture of
the Alamo
superimposed on the Texas flag. It is shipped
with a Leann
Rimes screen saver.

Also note the Recycle Bin is labeled Outhouse.
My Computer is called This Infernal Contraption.
Dialup Networking is called Good Ol Boys.
Control Panel is known as the Dashboard.
Hard Drive is referred to as Wheel Drive.
Floppies are Them Little Ol' Plastic Disc Thangs.
Other features: Instead of an Error Message you
get a Winder
covered with a garbage bag and duct tape.

Terminology:
OK = ats aww-right.
Cancel = hail no.
Reset = aw shoot.
Yes = shore.
No = Naaaa.
Find = hunt-fer it.
Go to = over yonder.
Back = back yonder.
Help = hep me out here.
Stop = ternit off.
Start = crank it up.
Settings =sittins.
Programs = stuff that does stuff.
Documents = stuff I done done.
Also note that Winders 98 does not recognize

capital letters
or punctuation marks. We regret any
inconvenience it may have
caused if you received a copy of the Texas
Edition. You may
return it to Microsoft for a replacement version.

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN.....

Hey,
My friend was looking for some info on the Family Radio Service. He has found that some of the freqs are GMRS also. He has a 2 watt motorola unit and recently found out that a company makes a 5 watt unit. All the info we found says you need a lic. from the FCC. Does anyone know how you get such a license? Also, is there anywhere you can buy these 5 watt units? Thanks, ryan

Hmm, that does sound like a rectifying dry joint inside the amp,
possibly not even in the input stage if the breakthrough is there even
with no cable plugged in.

GMRS does require a license and there is a fee involved. Almost all UHF business band radios are also type accepted for use in GMRS. I believe the GRMS "split" channels that are shared with FRS are limited to 5 watt. Regular GMRS channels are limited to 50 watt, if my memory serves me.

A search on the web under GMRS will yield you with all you need to know about getting licensed.
I have a 16 channel, 4 watt Uniden HT for sale or trade that will work on GMRS if you're interested.

I have 3 Hamsticks. Two for more than 10 years. Dont like most on-the-glass antennas though no experience with yours.

Have 9' 15m whip that I cut the coil out of and mounted home wound "bug-catcher" for multi-band. Been in the air for 10 years w/no spring either mobile or base. For 40/80 it gets bent over into an inverted-L with extra 25' wire from end of whip to pulley/mast on the other side.

Also a 9' 2m Co-Linear (9007) w/out spring for 8 years (look out for metal fatigue on fender) w/no breakage

However, I have heard of FG whips break from being hit by flying pebble.

For the price they are quite durable if not disposable.

Message-ID: <eYb54.47$N91.4768@typ11.nn.bcandid.com>
Source record: 15036

Got a President Washington that has VERY weak AM modulation.
SSB works fine so I know the final and driver are OK.
I have done all the following already
1. Changed the audio output/modulator chip (although receive audio and PA audio are good except when volume is turned up past about 12 o'clock, it squeals on receive)
changing the chip did not help any of this.
2. replaced the 2 transistors in the modulator circuit (Q34 & Q35).
3. changed or checked diode and electrolytic capacitors associated with the Audio output chip and modulator/AM power circuit.
This thing is about to drive me crazy.
Has anybody out there had this problem and it so what was the fix.
Please don't tell me to take it to a radio shop. I am a radio shop but just can't seem to figure this one out.
Thanks in Advance
Tony

I have read in a few of the Ham publications about the New Top Dog
for the FCC. If his leadership doesn't falter, you can never tell
maybe your plan could help. But how would someone ""police''' the
sunspot cycly??? When I had a CB station w/ mobiles 90% of the time my
range was about 5 miles, on the other hand , I could probably talk to
Aust. and S. America, but that was not the reason for the radios. I
spent a lot of money on Cbs, only to discover what I was really
looking for is inexpensive (in the long run) 2 meter fm, base and
mobiles. The base ant. is about 45 ft, with a range of about 20 miles
simplex to mobil, and about twice that with 'repeaters'.It is
reassuring when my wife and or daughter go into the city,that they
have
away to 'reach out ' if need be. Just my 2 cents on how to improve
your CB.

You do need a license to operate on the GMRS freqs with anything over .5W.
The FCC site you can visit for more information is
http://www.fcc.gov/wtb/prs/genmbl.html . You can buy handhelds from any
business radio company. Try
http://members.aol.com/crobbinsnc/radioaol.html for used radio gear, or
http://www.gmrsweb.com/gmrs.html for more info about GMRS and FRS radios
and their respective services.

Message-ID: <283beef1.816a1c18@usw-ex0102-013.remarq.com>
Source record: 15040

I was wondering if anyone could tell me the (approximate) relative broadcast ranges for handheld and mobile CB radios. Just to make it a bit more specific, I am considering something like the Cobra 75WXST mobile and the Cobra HH45WXST handheld. Also, with the mobile, I would probably be choosing between an approx 4' antenna on the hood or a 2' antenna on the roof. I am assuming from previous discussion that the handheld would be "worse" and that either antenna I mentioned would be "worse" than, say, a 108" antenna. Just wondering if anyone knew how much worse. Thanks.

DJL

1581. Re: Mod needed for the Eagle sidewinder

Newsgroup: rec.radio.cb
Date: 1999-12-13 00:00:00 UTC
From: Bendthelite@webtv.net
Message-ID: <22110-385549B6-24@storefull-118.iap.bryant.webtv.net>
Source record: 15041

The modification posted by Carl was actually written by me, he took my name off my post and then strated reposting it, and i just used this procedure three weeks ago to modify one of the newer style Eagle Sidewinder 400 radios that i bought. Unless Eagle has changed the radios again....which they just did a few months ago to make the units harder to modify for 11 meters, and so is very unlikely, the modification will still work.

Take off the bottom cover...with the front panel of the unit facing you look toward the front right side of the componant side of the board, you will see a 2 by 3 inch board that is elevated and inverted with its traces facing upward, it is soldered to the chassis to serve as a ground. Desolder the tab...remove the phillips screw and lift the board up a few inches and turn it over and locate Con1. The printing for the three Con1 holes that you need to find is white, cut the leg off a transistor and make a staple shaped jumper that fits in between holes 2 & 3, and after reconfirming you have got the right holes, secure the board so it cannot move and solder the jumper in place. If there is solder in hole 1 remove it, and remember that the holes are reversed when you invert the board as it was before you removed it, so be careful.

DO NOT BUY THE TIPS & TRICKS VIDEO # 9 FOR THE EAGLE SIDEWINDER 400 FROM COPPER ELECTRONICS...AS ITS CHANNEL MODIFICATION SECTION IS OUTDATED AND NO LONGER COVERS THIS RADIO !!

I have a feeling that you are looking in the wrong area of the radio...take another look, remember, its under the bottom cover, where the speaker is at, not under the top cover where all the solder joints are located...but the bottom cover. If all else fails send the thing to me, and i will mod it for you for free. Damon

AM uses only about 3 to 5 Khz of band width, where FM uses 10 to 15 Khz. In other words, you can have several AM channels in the same space as one FM channel.

While CB channels are normally 10 Khz apart, FM business and public safety channels are 20 Khz apart on low-band and 15 Khz apart on VHF high-band. In order to use FM on CB you would have to cut the number of available channels in half to provide the same level of modulation. (deviation on FM)

The problem:

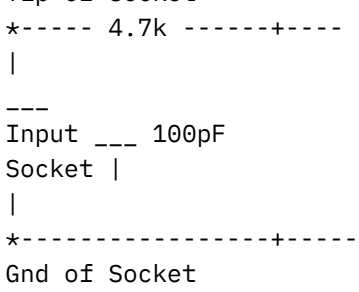
Solid state amplifier are prone to this behavior because of the non-linear behaviour of the semiconductors at the front end preamp.

I bet if you put your finger on the tip of the plug you hear the AM pretty well.

Solution:

-Don't bother with inductors because the input impedance is too high.
- Don't bother with a line filter as the noise is more than likely coming from the input.

Put a 4.7k resistor in series with the input then a 100pF ceramic capacitor to ground. Keep all component leads short and mount it close as possible to the input socket.



I guarantee this will solve the problem!

Regards
Rob

Source record: 14993

Thankfully, Tim, the days of hashy switching power supplies are winding down. If you stick to a reputable brand name, that is to say not a "hobbiest quality" one, you should be in good shape. Switching supplies generate maximum noise when they are generating maximum current. In your case this'll be Tx. The hash noise is very unlikely to have any effect on your transmission. It is the noise from the supply getting back into your Reciever that will cause grief. I like Astron linear power supples, but I don't trust them to make a decent switcher. I repaired one the other day that used a 556 timer for the switching function and the threshhold of conduction on an NPN transistor for the "reference". It works, but this design is about 20 years out of date now. I would recommend something from the folks at ICT. Very good value, reliable, specifically made for two way radios and they have models for all the current you'll ever need - up to 100A.

I am not affilated with ICT in any way.

MC

1598. Antenna/SD Area

Newsgroup: rec.radio.cb
Date: 1999-12-14 00:00:00 UTC
From: edgunn@my-deja.com
Message-ID: <834d3a$9c2$1@nnrp1.deja.com>
Source record: 14997

Hey - I park in a garage every day, so I can't leave my antenna mounted to my roof (low clearance). It is a Wilson 1000 mag mount, so I take it down and put it in the back of my SUV, which means it lays on its side for a few hours a day. Then I put it back at the exact spot where it was previously. Does putting the antenna on its side like this affect its performance?

On another note-
Are there any good CB clubs that operate in the San Diego, CA, area? If so, when and on what channel?

Sent via Deja.com http://www.deja.com/

Agreed! Specifically:

>>I have a friend I can here on any channel because they are 30 ft from me.

That's too close for me! Maybe that's why he used the word "here" instead of "hear"?

>>I talk to him a lot.

If he covered up every channel, I'd talk to him a lot, too! And not too nicely!

>>From what he tells me and what I have seen, the FCC is at his house often.

If I saw the FCC at the house next door even ONCE, I'd be afraid to talk to the neighbor. The FCC seems to hang out over there. No wonder there is no enforcement anymore. They're socializing with this guy's neighbor. He must serve good coffee and donuts. Or maybe it's something else....something sexual? (Gasp!)

>>When they take his stuff, he just goes out and buys more
>

Every Troll slips somewhere. This was BlueDevil's trip-up. When the FCC takes your stuff, you don't go buy more. First of all, if there was a fine involved (Notice of Apparant Liability), you don't have any money to buy more equipment. Second, if you're married, your spouse TELLS you that there will be no more radios. From now on, the money in the household goes for food and clothes and to get the kids' teeth fixed. Oh yeah, and let's do something about the bald tires on her car! Do we love our wives, or WHAT?

Third, and this is very significant, the court frequently bans the offender from owning or operating radio equipment for life, or for a period of years, unless required as part of one's occupation. (A taxi driver still can have a radio).

I sincerely doubt that this guy's neighbor keeps buying more equipment. On the other hand, some folks don't learn very fast.

... rest of quote deleted ...

The regulations do not apply to exempt transmitters. In the 11 meter
band, a final input of less than 100mw and an antenna that is under a
specified length is exempt.

It is NOT a CB station - it is an experimental unlicensed transmitter.
Read the regulations that cover such transmitters - the rules are very
explicitly spelled out.

: But anyone with a cable ready TV can receive it if they are close enough?
: That would be some cool shit.

No. As the other person stated - it requires some special equipment.

For one thing, the scan rate is very slow - as is the data transfer rate.
So if you move slightly in front of the camera, the picture smears. It is
best for static pictures - such as a card with your call letters on it.

Sounds like you really have your act together there, Boo. A scope that does not read ACCURATELY to at least 125+ Mhz is just about useless for working on radio gear at our freq's. Most people don't realize that a 40 Mhz scope is really only accurate to about 20 Mhz or so. The frequency that the scope is rated for is the 3 dB down point.

From my experience, most cheap scopes are severely bandwidth limited and have a hard time making spec. Once they start to roll-off, they take a severe nose-dive in performance. For my money, Tektroniks or H-P is the only way to go. They cost more, but are built 100 times better than any of the others on the market. They will easily surpass specs and last much longer than any of the budget brands. I had a quad trace 275 Mhz H-P with digital storage (very early version, but was still about $20K when new). Turned out that my trusty old Tek 465's gave better overall performance. Gotta love those ugly old antique's :)

I can easily tell when someone does not have a scope or does not know how to read the one that they have (the mass majority of radio shops and "tweakers"). This is very obvious on some radios and especially amps. Some of these folks are paying guys to "hot rod" or "super tune" their amps by changing part values or adding trimmer caps, etc... Sure, the power looks impressive on the meters, but it is all harmonics and oscillation. What they don't realize is that the amp is actually doing LESS power than before the modifications to it. Besides greatly reducing the lifespan of the amp & pills, they wonder why they have swr problems ONLY when the amp is on !?!?!?!

Your observation about amps with bias going into oscillation is right on. The bias adds stability to the amp. If it still oscillates, it is a REAL piece of junk or severely out of tune. The little "blue faces" tend to do this and have come WAY down in quality over the years. This is not to mention the amps that NEVER were quality in the first place.

The trick about raising drive levels and playing with the keying circuit to add stability is an old one. Unfortunately, some of these folks take the "back-woods band-aid" approach to designing / building things. I'm glad that we've got a few guys out here that have enough sense to know which end is up. Sean
>

-=BOO=- wrote in message <834b7d$k9h$1@nntp4.atl.mindspring.net>...

Sean, I have seen this as well, if you ever see this on an amp that is biased with any voltage on the base of the transistors, that's when you really worry, it seems to me that on some of the amps the reason it does this is because there is not enough voltage present on the base of the

transistors for them to fully function, in some cases it is like not all of the transistors were "keyed up". I have seen people attempt to fix this problem by redoing the keying circuit so it required more key to pull in the relay, therefor applying more RF voltage on the base of the transistors at the time of the relay making, They simply hid the problem instead of fixing it. Also a lot of the guys that repair these amps don't have a scope, or the scope they use does not read very high, say 20 or 40 MHz. My scope is 275MHZ, combine that with a spec analyzer and it is hard "hide" a oscillation problem.

<<no matter how hard you try, no matter what rules are going to be made
(or lobbied) by you HAM's for CB'ers, the problem will never go away>>

Rules for CB'ers aren't being lobbied for by hams. The Ehlers Bill and similar
legislation was born from interference complaints by average citizens
fed up with having to tolerate their local 27 MHz splattermeister and getting
little or no action from the Feds.

<<For every one CB'er busted for running more than 4 watts on AM and 12 watts
on SSB, there is 5-10 newbies to take their place. Learn it, live it, deal
with it!
Fact of life.>>

Maybe the problem won't go away, but things could get tough enough so that
only hard core outlaws would remain.

This amp EASILY pulls 70 amps if being pushed. They are a pain in the ass
to work on too. Feed it some heavy wiring and don't drive the piss out of
it. It will last a lot longer this way. Sean
>

>there someone who works on these? Thanks Alan
>
The LA 900 is the same unit that used to be called TX 800. The Input drive
is
6 watts or less. The max current draw is around 70 amps. The LED that says
heat comes on if the amp reaches 175 degrees or hotter, lets you know to let
it
have a breather.

1621. Re: Chevy V's Ford was Euro 3900

Newsgroup: rec.radio.cb
Date: 1999-12-14 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <yZl54.71$A%2.22113@news.corecomm.net>
Source record: 15070

Ford has always made heads that take deep breaths, but they never know how to exhale. A perfect example is the Mustangs of a few years back (5.0 liter). Four SMALL catalytic converters ??? Put that on a Camaro and see how it runs !!! As it is, the 302's KILLED the 305's.

For another example, take the Boss 302 or 351 Clevelands. They used intake valves and ports as big (2.19") or bigger (2.21" earlier versions) than 454 Chevy's. Too bad they had horrible dog-legs in the exhaust ports and choked the piss out of power output. 429's and 460's also suffer the same "potato in the tail pipe" exhaust port design. This does not include the Boss 429 or (to a lesser extent)the 429 Cobra Jet / Super Cobra Jet designs

Ford also made far more racing parts in the muscle car hey-day's than any other manufacturer. Take the 427 for instance. They had the standard "low riser" heads, "meduim riser" heads, "hi-riser" heads, "tunnel port" heads and even "single overhead cam" designs. Each one used different port and valve dimensions and was tuned for different RPM ranges.

The 351 Cleveland also used different heads for the 2 and 4 barrel versions. While Chevy changed intakes and lost cam duration / lift when going from a 4 to a 2 barrel, Ford changed heads, port sizes, valve dimensions, etc... The lowly 2 barrels used 2.05" intakes while the Chevy "race-bred fuelies" on the vette's were smaller 2.02" valves. The Ford 4 barrels used 2.19" intakes for their 4 barrels and race versions.

Ford also made more dual quad and six pack equipped cars from the factory than any other manufacturer. In fact, as far back as 1955 you could purchase a V-8 with dual quads and a Paxton Supercharger from the factory an option of the 312 found in the early T-birds).

Just for the record, Fords won more Nascar races from 63' - 70' than all other makes combined. Here's another one just so that you don't think i'm overtly biased : I have owned more than a dozen GM's (Big block Chevelle SS, 482" Joe Mondello Olds with Batten heads and 8 Webers in a T/A, turbo'd 355" Chevy in a T/A, several 355" camaro's, etc...). I still own an old Stingray Corvette. If it came down to it and i was going to restore another old muscle car though, it would be a Ford. Just my preference (although you can't deny history). Sean
>

Matthew wrote in message <38558480.5E78@execpc.com>...
comparing a 302 to a 350 is like apples to oranges... or should I say cherrys to lemons. Try comparing something of the same basic block size like a 351M to a 350...

Pretty much have to agree. While the 122 can be a decent talker, it is noisier on RX and is a pain to modify. You also have to install an "expo kit" to get channels in it. On an SSB radio, this means that the radio will NEVER be properly aligned on frequency for all modes in all the bands. Save your money and buy a more worthwhile rig. Use the 122 as a back-up. Sean

>me.
> Thanks for any info.

Fella, for what it's worth, please heed this advice. Sell the 122 and get a SuperStar 3900. You'll have all your channels, a much better taking radio, and
only a few more $ than you'll have in that 122 after adding channels, and 122's
are very low performers.

I have noticed that the Connex 3300 series radios have gone down in quality lately. They are using cheaper transistors, lower grade capacitors, etc... to keep the costs down.

As to the 4400, i'm assuming that it uses the new style board. Good power and modulation along with killer RX (maybe TOO good with all of the noise right now) make for a solid radio. Like any of the other "export" type radios, it will need some TLC before going out the door though. Find a competent shop that will ruggedize the chassis and inspect for bad solder joints BEFORE selling you the radio. Make sure you get a good warranty too. Stay away from anyone that mentions "super mod'ing" your radio. Sean

A friend of mine has a mint, and I do mean mint Teaberry Tele T 23 channel base cb radio that is still in the original box with all the papers and foam. I believe this radio was made in the early 1970's. If you have any idea what this radio is worth please email me and let me know.

It even has the FCC application for the CB license with it. I have never seen something this old, in this condition.

I have pictures of it if interested.

Sean,
You forgot the real jewel...
68 1/2 Super Cobra jet Mustang..
428 aluminum head one 4BBL
390(conservative HP)
They did 105 1/4 mile from factory with high speed rear end at like 13 sec. Put a 4.88 under it and low 11.1 1/4 mile times were there with a only a tune and hooker comp headers. That was a real factory hauler. Stock top end was enough to take most vettes. It screamed.
The secret on the 289-302 blocks was to put 351 winsdor heads, larger valves, mill.40 off the heads to keep up compression, and do the 6250b cam, offy 360 intake, holley 650 dual pumper , accel dist.,headers....400 hp. I did one of those in a stock 66coupe....Oh, don't forget to upgrade the radiator, it has to get the heat out.
It was factory wimbledon white with the blue center wires, burgundy interior. Looked factory stock, 11 discs to stop it. Yes I stole a few Z28's at the stoplights :-)
51 is outta here.................

1636. Re: Thoughts on Lakeview Antenna Company (Hamstick)

Newsgroup: rec.radio.cb
Date: 1999-12-14 00:00:00 UTC
From: griffithj@my-deja.com
Message-ID: <835rp9$9r3$1@nnrp1.deja.com>
Source record: 15085
Cross-posted to: rec.radio.cb,rec.radio.scanner

I have used the Hamsticks and ordered them from lake view each time. Yes I did back into something and snap my 40 meter hamstick off right at the base. I got to see how they were made in doing so. Then the price for the hamstick went up to $24 or something like that, an I felt the price a little high. So I had already invented a new mount for my truck, only works for someone with a real bumper, I designed a new mast, made my own single band Hi-Q coil for 40 meters and 20 meters.
The difference between my homebrew Hi-Q (mush less bandwidth) system and the hamstick, is I built the antenna for about the same price, and the receiver came alive. With the hamstick I never had QRM problems mobile, with the Hi-Q system I have to use filtering because the antenna now has real ears not just, for lack of better words, and in Don Johnson's words, "A dummy load on a stick". The hamstick works, and I was impressed with how well it worked for 19.95. But after building my own Hi-Q system, the hamstick is a " dummy load on a stick" for $24.95 plus shipping. If you don't have a real bumper, then the hamstick type antenna is still your only option for low profile mobile work. My antenna is only a foot longer then the hamstick and requires support at the tailgate edge, but the performance was worth it. I run 50 watts PEP from a TT Scout. For me I always want to own a real bumper.
These are my personal building experiences and comparisons.

1637. Re: PHASING HARNESS FOR FIRESTIXS

Newsgroup: rec.radio.cb
Date: 1999-12-14 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <835mochrk1@holly.prod.itd.earthlink.net>
Source record: 15086

With big trucks, and antennas on the mirrors (they can't really
get them high enough without getting them 'picked off' all
the time) it really does help having two antennas.

It's not so much that they are trying to 'cophase' and get a front/back
directional antenna (although if they do get it wide enough, it might
help somewhat) it's just that they have this huge metal shield out
back they want to get around.

So from a truckers point of view, with a single antenna he has a
VERY distorted coverage pattern that IS directional. Having TWO
antennas DOES make it appear, to him, to be more general in
coverage.

Besides, is he REALLY going to get those antennas far enough apart
to make his pattern all front/back?

Mike

From: W8EMS@webtv.net
Message-ID: <3340-385655A2-106@storefull-126.bryant.webtv.net>
Source record: 15087

You are correct on the 2.5 Khz deviation for the new systems, however have you listened to a 2.5 Khz transmission on an older receiver set for the normal 5 Khz? The audio is extremely weak. In fact, the new radios will have to have extra stages in order to bring the audio up to an acceptable level.

Given the current state of CB radio where AM transmitters are modified to the extreme, can you imagine the temptation to "peak" the deviation on an FM rig? We're talking wide-band here!

Let's not forget about a little guard band here also. With channels 10 Khz apart, the signal can't take up the whole 10 Khz. There has to be some "empty" space between channels to prevent splatter.

While I fully agree that FM has advantages, such as better audio, capture effect, less interference from static and other noise, I can see many problems if FM were allowed on the same channels as AM.

Just my opinion. Thanks for reading.

1639. Re: CW on CB

Newsgroup: rec.radio.cb
Date: 1999-12-14 00:00:00 UTC
From: W8EMS@webtv.net
Message-ID: <3340-385658CB-110@storefull-126.bryant.webtv.net>
Source record: 15088

Was the original poster speaking of the legal definition of CB as a radio service, or was he using the term CB to refer to the 27 Mhz radio band in general?

Perhaps I was in error when I assumed the latter. No, CW is not legal when transmitted from a station which receives authority to operate under part 95.

However, CW is legal when transmitted on the same frequences by a station which is authorized to transmit under part 15. It is also legal in some other parts of the world which uses the 27 Mhz band for other services.

Hope this clears up the confusion.

Hi MC,
Thanks for the response.I didn't think the IMAX would be better than the ground plane.However, I was wondering if it was as good or nearly so.It would be soo much easier to put in a tree,because of the lack of radials.I have a tower but am planning to move soon.So I don't want to put up the tower here.I would like to get an antenna in a tree though.The ground plane at 30ft just don't get it.Also at 50or 60ft should I be concerned about lightening?
Thanks much
Rob

1646. ANOTHER REDNECK JOKE!

From: prozac 625 <prozac625@bayshorenetwork.com>
Message-ID: <eWu54.2804$mv4.57024@news.rdc1.nj.home.com>
Source record: 15095

A small Georgia Wild Animal Park had acquired a very rare species of gorilla. Within a few weeks, the female gorilla became very difficult to handle. Upon examination, the park veterinarian determined the problem. The gorilla was in heat. To make matters worse, there were no male gorillas of the species available. While reflecting on their problem, the park administrators noticed Ed, a part time redneck intern, responsible for cleaning the animals' cages. Ed, like most rednecks, had little sense, but possessed ample ability to satisfy a female of ANY species. So the park administrators thought they might have a solution. Ed was approached with a proposition; would he be willing to have sex with the gorilla for $500. Ed showed some interest, but said he would have to think the matter over carefully. The following day, Ed announced that he would accept their offer, but only under three conditions: "First", he said. "I don't want to have to kiss her. "Secondly, you must never tell anyone about this." The park administration quickly agreed to these conditions, so they asked what was his third condition. "Well," said Ed. "You've gotta give me another week to come up with the five hundred bucks."

1647. Lay Antenna on Side?

Newsgroup: rec.radio.cb
Date: 1999-12-14 00:00:00 UTC
From: edgunn@my-deja.com
Message-ID: <836b45$m0t$1@nnrp1.deja.com>
Source record: 15096

Hey - I park in a garage every day, so I can't leave my antenna mounted
to my roof (low clearance). It is a
Wilson 1000 mag mount, so I take it down and put it in the back of my
SUV, which means it lays on its side for
a few hours a day. Then I put it back at the exact spot where it was
previously. Does putting the antenna on its
side like this affect its performance?

On another note-
Are there any good CB clubs that operate in the San Diego, CA, area?
If so, when and on what channel?

In a high current linear amp, you don't want a floating ground system.

They did it back in the CB boom days because of the positive ground vehicles... Not because it was anything "magic" or because it makes them better...

As a matter of fact, the dual ground thing made the amps more unstable.

Your showing your ignorance again, Mr. 108" antenna.

Only by using it on its side. Laying it on its side will not "ruin" it, if that is what you are asking... If you actually use the antenna (e.g.. talk on the radio) while its on its side, then yes, performance will be hindered and you may ruin your CB.

I myself prefer the Tektronics scopes, I at one time had a friend in the
military surplus department who really fixed me up, so I got the deal of a
lifetime, it included the tek scope, hp spec analyzer, real nice hp signal
generator, and a hp signal analyzer, it was one of those deals where I
took care of him and he took care of me, He like to run big volts and big
key
andddddddd, well you get the idea.

> !?!?!?!
Yeah it is a common problem with a lot of amps, I probably don't see
near as many as you do, as I work on only my own and good friends, I am an
electrician by trade, but still have seen a lot of them out there that I
personaly could blow in a matter of seconds because of poor craftsmenship.
I do most of my electronics tweeking as a hobby, I like to keydown, and
I'm sure alot of it is a pride thing, I just like to find and fix my own
problems, that way I know exactly how far I can take it... and when you
are drag racing, thats what you have to do sometimes.

I prefer the bias grounded for what I do, but I have played with a
regulator circuit before that kept the voltage stable on the base of the
transistors, hell I ran the thing at 19 volts on side band for a good 20
minutes and never had any problems, and the voltage on the base was the
same at 20 or at 13.8 volts, even under a load, pretty cool, but scary to
test the first time.
Either way, I would not settle for anything less than completly clean
output, throughout the input range.....PERIOD. if there is a bunch of
parasitics, then it isnt right

1669. Tram questions

Newsgroup: rec.radio.cb
Date: 1999-12-14 00:00:00 UTC
From: "R.J." <rjmcman@nb.net>
Message-ID: <ZTA54.41$LF5.295@newsfeed.slurp.net>
Source record: 15218

I have acquired a Tram D42, and I was wondering how well this radio is built. It looks like some o fhte solder joints were crappy, but now that they are fixed everything is A-OK. It seems maybe someone even swapped the output transistor, does anyone know what should be in it? Also what exactly does the Delta adjustment do? I'm going to give the pots and switches a good cleaning and everything should be in order, unless someone has had their fingers in it. Thanks.

1670. Re: Teaberry Tele "T" info needed

I have one of these units but it is the 40 channel version. Mine is not
mint. I would be interested to know it's value as well.

Don't think you can get much more mint than that!! Value?? Depends on how bad the buyer wants it!! Being it's a 23 channel, it is more for a collector than a user. I know Teaberry is legendary, but personally I would place a starting value between $30.00 (Low) $40.00 (Fair price) $50.00 (Tops)

Don't mean to offend anyone, but let's face it , CB isn't used much by the mainstream public. Best of luck,
Ed N3KEX

I've got an IMAX at 55' and couldn't be happier. I had it up higher in the air and found after playing with it, etc. that it worked best at 55'. I don't have any tvi or problems of any kind. I think most interference is caused by poorly tuned radios, foot warmers, etc.

Something in your setup wasn't up to snuff.

I can run 3.0 Kw in my house, and nobody complains... Anything more, and I have one neighbor that I get into.....

When I push over that, More and more people start "arriving" to say hello at my door.

It is all in the COMPLETE setup..

And no, I don't live in the bush... I live in a normal neighborhood... My lot is right about 1/3 acre, and I live in th middle of the subdivision!

Usually when you get the squeal on that chassis (the single conversion 8719) with the volume control, it means one of a couple things (bear with me... Been a while since I was on one).

The mic is incorrectly wired, or their is a choke on the back of the plug board... It sometimes shorts.

Their is a blown bypass cap, causing RF to get into the thing.

One of the caps in the feedback networks (on the preamp side, that services both the audio preamp and modulation preamp sections... They do double duty) is failing, causing too much feedback in the circuit, causing the squeal..

However, most where fixed with the mic replacement / checking to make sure it was wired correctly (the old G stand D-104 did this when people tried to mod it to work on an electronic switched radio) or the solder connections on the PC board behind the mic jack and it's associated wires where checked.

>
> Why not, Martin N5PZJ?

Because of International Treaty. For use below 30 megs, above XX watts (the number escapes me at off top of my head) you have to know CW. Period.

Why can't the FCC change the rules and make 27 MHZ a
> Worldwide Communication Band?

Because of International Treaty. For use below 30 megs, above XX watts (the number escapes me at off top of my head) you have to know CW. Period.

Like I said before, they sure as hell can
> take away CODE to attain a lesser form of a HAM Ticket.

Only above 30 megs. Below 30 megs is a completely different ballgame. That is why all bands above 30 lost the CW requirment, but the bands below kept it.

> I'm done. I'm never coming back to this thread.

\

Oh well.

Sean wrote:

> Your observation about amps with bias going into oscillation is right on.
> The bias adds stability to the amp.

I find just the opposite. Bias increases the small signal
gain. That increases the amplitude of the harmonic and
parasitic content.

> If it still oscillates, it is a REAL
> piece of junk or severely out of tune.

In my experience, reducing the bias reduces the level
of "garbage" in the output signal when an amp is
somewhat unstable. In other words, other factors
are the cause of the instability, and adding bias
just makes it that much worse.

> The little "blue faces" tend to do
> this and have come WAY down in quality over the years.

I've never seen a Blue Face go into oscillation
even when the output SWR is way off. There's a
big difference between instability and oscillation.
An amp that is oscillating actually runs by itself.
An unstable amp has unusually high harmonic and
parasitic levels but will not run without an
input signal. Oscillation is instability taken
to an extreme.

The 200, 250, and 350 XL series Blue Face amps are
overbiased when in the "max" position because the
bias rides in with the input signal and is reduced
right along with the input signal in the lower
output positions. This causes a higher level of
instability than would ordinarily be seen with
lower bias. The solution is simple: either use
a lower output setting (avoid the "max" setting)
or reduce the bias by clipping a leg of (or removing)
one of the bias resistors. The 225s are not over-
biased in their highest output position, and the
450s use a very well done, fully regulated and
adjustable bias circuit where the bias is separate
from the input signal. The 450s can be made more
rugged by reducing the bias. It's a simple pro-
cedure to change them from AB to very close to B

class. There are two bias adjustment pots with
arrow-shaped screwdriver slots in them. When
stock, the arrows point toward the rear of the amp.
Simply turn the left-hand pot to its fully clockwise
position, and the right-hand pot to its fully
counter-clockwise position.

As for the quality of the Blue Face amps, it hasn't
changed in the time that I've been dealing with them.
The Blue Face amps still have the best build quality
I've ever seen in a production (mass-produced) CB amp.

To Sean: If you have access to a digital camera,
we should exchange pictures of the Blue Face amps
that we've dealt with. It seems like you've always
been down on them, and I've always viewed them as
one of the best. It's like we're dealing with two
separate amp lines but calling them by the same name.

> I also believe this is why some Cobra 148's and radios of this type show
> amplifiers doing monster watts.
>

Actually,

The MB8719 chassis has been able to show monster Bird watts for quite some time...

This is because of a couple reasons..:

Mainly, the MB8719 chassis does not have the capability for the monster negative carrier shift that the Galaxy and other lines do... This is also the reason that the tonal quality at overmodulation is different. The Galaxies will do "Dog Shit Loud" audio, whereas the 148 will keep a growly loud.

If you look at the scope with the limiter clipped on both the Galaxy and the 148, you will see the line that occurs between peaks is longer on the overmodulated Galaxy (and also on the transformer modulated AM radios).... This is because the moduator transistor (as simple voltage regulator) is designed different (and acts different) than the one in the 148. The Galaxy will hold it negative farther, but the 148 will hold positive longer, effecting more "Bird Forward Swing".

Also, the bias circuit in the 148 final can be fiddled with to give much more forward bump... And that is the easiest way to show 7 or 8 watts Bird on the 148 chassis... Whereas the Galaxy doesn't do this... This has to do with the methods of regulation, as well as interaction with the above mentioned phenomenon.

You can change the biasing of the regulator section of the Galaxy to see nearly the same thing, although when done, the Galaxy does slightly more than the 148 (as it should be, being a double final radio!!!).

Hope this helps.

Well, considering it is a Wilson 1000, VSWR would probably still be reasonable if you were to place this antenna horizontally, though, I wouldn't necessarily try it. I've seen (performed) a Wilson 1000 on a concrete filled metal pole once, and only had 2:1 VSWR.

In any event, STORING it on its side, on the ground (not advisable due to dirt) will not damage this antenna.

> More noise on fm

If someone hasn't already told you, there is less noise on FM unless you include the "shot" noise heard in the speaker when the receiver is unsquelched. I figure this noise doesn't really count because you don't leave an FM rcvr unsquelched during normal use. Under almost all circumstances FM is less prone to most noises than AM.

There was another JB2000 that used a pair of 3-500's and had a
small driver stage tube also. I forget the driver tube number but it
allowed a low power rig to drive the amp to hi output.
The transformers in these were pretty light duty so don't leave
it keyed at full output very long.
I'm afraid I've been out of the CB stuff too long to be able to
give you a recent price on one of these.
BobC.

Prozac,

I have yet to try this, or even give thought to whether or not it would work... But, make yourself a little 5/8 wavelength antenna for channel 3 or 4 (dont have my ARRL handy, so, I have no idea what ranges video/audio would be).... then buy a line amplification unit from Rat Shack, then hook everything up starting with a VCR set to whatever the antenna was built for..... VCR - Amplification Unit - Antenna

As I said, I haven't even thought about it, but now that I typed it out, it may work to a point, but nothing like a neighborhood type deal..... There ARE cheap kits usually being auctioned on EBAY..... other than that, do a search on the web...

It is illegal to monitor 868 to 896 MHz with a scanner in the US.
Uses 30 kHz channel spacing. Gets boring quick. Try cordless phones.

I can easily agree with Mr. Hall. I will go a step farther in
saying it will help if you must use a linear. If you're running one
of those "near class c" amps then this will minimize the distortion
and resultant products leaving your amp. Hence, the rfi is minimized
or eliminated. If you're running a decently biased amp but feel the
need to overdrive it on voice peaks then this will help as well
because you won't have to back the carrier off to get more swing
i.e. headroom and you wont be overdriving the amp into distortion
without the voice peaks. Hence, less distortion and less distortion
products being transmitted.

I believe that if installed right and the equipment is right, modulation kept at a respectable level, you could get away with a small broadcast station, but a lot of that will depend on the neighbors equipment as well. A lot of computer speakers with built in amps for instance, have roughly a 9' wire feeding the speakers, hell my speakers had 6 wires, 4 to the speakers (5 speaker system) 1 to the volume control and the power wire...all of these were 9'2" long, what a joke. Man you could bleed on those speakers with a walkie talkie in the front yard. A handful of .01's and a handful of ferrite beads and it is now bullet proof. I wish some of the equipment built in this and various countries would get the same treatment, maybe we would not have such a problem, the government had to let employs go because of the budget, no wonder with all the complaints, and to think that this probably could have been cut in half if they (FCC) would just enforce the laws on the filtering required on the electronics nowadays.

Cleaner as far as switching distortion, but not cleaner
as far as harmonic and parasitic content or AM audio
signal quality since there is no information being
conveyed at the crossovers.

> The majority of "no bias" amps typically run into problems in
> this area due to the different levels of "gating" involved and their various
> gain curves. The more pills involved, the bigger the variance and the
> problems. With no bias amps, one transistor might be fully on while the
> other is on the edge. Talk about an imbalance in output !!!

If the drive signal is not split equally there
will be an imbalance regardless of the level of
bias. Bias and the input drive signal are separate
entities. You're more likely to have an imbalance
with a biased amp because the bias to the different
pair can be unequal. That can't be a problem when
all the transistor bases are DC grounded.

> As to the Blue Faces, they are the same ones. I have had MAJOR problems
> with the 450's and don't recommend them at all.

I think the 450 is a good amp and have never had
any in for anything other than the usual abuse-
generated problems.

> All of those amps use
> little "weasely" relays that don't hold up well.

I agree that the relays are small; however,
I've only had to change one, and that was
one that was defective right out of the box
in a 225.

> This is not to mention the
> complete lack of quality control. I have had brand new amps come in that
> had parts that were not soldered in, pills that were not properly seated,
> etc....

I've never seen a line of amps that was more
consistent in its quality. Other than the
225 mentioned earlier that had a bad relay,

I've never had a problem with any of them
coming in with problems.

> If you want to see these amps get REAL squirrely, put a metal lid on them
> instead of the plastic lid. There's a reason that Otis went to the plastic
> and it wasn't strictly a matter of economics either. I know that Dennis has
> experienced the same problems that i have (not that this means i am right
> and your wrong).

I remember corresponding with Dennis about that.
He told me that it was a different brand that
bought parts from some of the same sources.
I think he said the brand was "Red Devil" or
something like that. I've tried the metal lid
thing in the past and didn't notice any difference
in performance.

> I used to like the blue faces before they were known as blue faces. That
> basic design has been around for a long time.

I remember the old Palomar Magnum Series amps.
I don't see the new ones as being any worse
overall. They could use bigger relays; but,
in my experience, relays are an expected
problem area regardless of which ones are
used. Running the bias in on the input
signal isn't the best way to go, but the
mod I mentioned handles that painlessly.

As to your addendum in the next post about
Texas Star being your favorite produvction
amp, I tend to agree that Texas Star is a
good choice. However, they too have their
minor, irritating issues that make them less
than the only and always best choice.

Oftentimes, setting it for 70 or less is better.

Or, you can do like I do and just hit "return"
at a convienient place where you know you're
not going to run past the screen edge. That
technique works particularly well when responding
to other people's posts. Tabbing out (like you
see here) is a nice touch as well. These extra
keystrokes may seem like an unwanted hassle, but
once you're used to doing it you don't even notice
them anymore.

Overdrive. They're only 2 watt pots. They
are especially susceptible to overheating when
set to a low resistance position that's not
zero resistance. In other words, when they
are set to almost maximum but not quite.

This would not work, because as you put more RF into the amp and the
transistors fully "switched on" then you would really have an imbalance.

Man that would be scary, to see enough RF in to burn up a balancing
resistor, yet not be enough to "switch on" one of the transistors,
especially if all the transistors show good.

I also run a Kenwood TS440SAT to do this. That type of radio has to be kept at near 100 percent audio just because it sounds like shit when overdriven.

When a real 11 meter radio comes in the house, bye bye to the amps.

The transformers are rated at .6KVA, so keep the carrier in the 400 watt level, and they will last forever..

Same thing with the SB220 and 221.

I have done it.. To prove a point.

Use Motorola devices and put a standard yellow dot device on one side of the
2 pill.

In the remaining 3 holes, put double dot black devices.

The gain of the double dot black is so much higher that it will begin
conducting WAY before the rest do.

There. Done.

Well, I'm not an engineer nor do I normally repair guitar amps.
However I do think I have an answer for you.
Apparently your inputs are balanced according to what I think I
read while skimming through the posts.
I suggest that you install, at the jacks, a capacitor across the
balanced part of the jack or input. This doesn't mean to chassis
ground necessarily although this may be a second option. You'll need
to determine which two pins are the input legs in each plug/jack
combo.
What you'll be doing is eliminating the difference of potential
across the two input legs. If there's no difference in potential
then there's less chance for the input op amp or transistor to
become biased into becoming a rectifier. By placing the cap across
these points you've made sure that the rf voltage is pretty much
equal on both legs.
The value of the cap will depend on the frequency of
interference and the input resistance of the amp. If these are hi
impedance inputs then I would start with a 100 pf. cap. You may need
a higher value which you can parallel across any other caps there.
You don't want to go too high in value as this will start to
roll off the high frequencies of your guitar or mic.
If this helps but doesn't eliminate it completely then you might
also install a cap from either side of the one you put across the
legs, to the chassis and see if that improves things.
Unless you are really unlucky this should work. If it doesn't
then you might invest into a shop to "rf proof" your amp the best
they can.
I wish you luck.BobC

BobC writes:

There is a time when the rigs' carrier is going to be off during
modulation when not limited to less than 100%. negative modulation.
Not unlike SSB, when the drive gets below the turn on voltage of
the finals there will be no conduction in the transistors. When the
drive starts to rise, it must pass this breakover voltage to get the
transistors conducting again. At this point you have crossover
distortion as Sean said.
So, in essence, there is a part of the information lost in the
crossovers when not biased right.

Perhaps I can shed a little light on this statement. First of all, nothing is absolute, so running FM is no guarantee to eliminate ALL TVI problems.

BUT, if you are experiencing interference from RF rectification, which occurs when your signal leaks into a piece of amplifier gear, and gets rectified, and appears as audio on the output (Radios, TV audio, stereos), running FM will, in most cases, eliminate the sound of your voice from coming through the speakers. This is due to the fact that simple rectification cannot reproduce audio from a frequency modulated signal. You will still hear a faint buzz when the station transmits, but that is usually not as noticable as a loud voice booming in.

This is usually the only time that FM will reduce RFI. If your transmitter is dirty, and causing herringbone patterns on TVs, running FM will not change anything. If your signal is just so strong that it overloads the tuner or front end of a TV, stereo, cordless phone etc, then running FM will not eliminate the problem, although your VOICE may not be discernable in the interference.

With this in mind, running FM can help you to get away with some interference. Since your voice usually cannot be heard, it may take neighbors longer to figure out that it IS interference (As opposed to something actually wrong with their TV), and if you live in an area with more than a few radio ops, figuring out which one is the cause will be tough.

THAT is amazing. Where I used to live, I had people complaining while I
ran 4 watts! Radio was as clean as a baby's butt, antenna was grounded
(And it's not an A99), but I have no control over the cheap unshielded
junk that people buy. I find it truly amazing that you can run 3 KW and
not get picked up by some cheap radio or phone. Your RF signal is stong
enough by itself, even if it is clean, to overcome the weak shielding
that passes today. Is your utility wiring underground? That helps too.

This doesn't apply to Citizen's Band, however.

We call it "CB" in the United States, but under international treaty it's simply a "land mobile" communications service, no different from the cops, ambulances, or cement truck drivers.

That part of it (not all Part 95 is on HF, remember) is on the HF bands is non-sequitor. The FCC is responsible for regulating it, but there is NO ITU requirement that land mobile radio services MUST know Morse Code. Only Amateurs now, whereas only a short while ago it was Amateurs and maritime RO's. The list grows shorter!!

I recently installed a uniden Pro510xl, I am having a few noise problems.

1) I hear myself talking throw my stereo speakers. Why?

2) I get noise when I unlock doors, or windows , blower motor, or accelerating, my truck is all power, Why?

Is there anything I could do to resolve these problems?

Actually I was refering to the authorized CB channels for normal CB
operation under part 95.
Sorry for the confusion here.
I still think it would be a neet idea , and bring something new to the
CB band.
I will probably send a message to the FCC to get their response.
Thanks to alll that replied

Source record: 15174

Well, I'll only comment on the hardware involved, not about band usage, etc.... However, I personally would like to see the FCC allow low-deviation NBFM (that is, compatible with existing 10kHz channel spacing) use on at least some of CB's 40 channels.

Most CBs & related "10 meter" rigs are, frankly, not really super great radios unless you say "they're good for the price" (True.) These rigs are already a fairly low-cost item (hell, even a Grant XL or Cobra 148 or HTX10 is, what, $120 or $140? I've spent quite a bit more for dinner for two!) with razor-thin margins for the manufacturer, importer, and dealer.

Every little thing is done to shave costs. Since these radios are regarded as "consumer" items, more effort and expense may well be expended on chrome plating or panel backlighting than on improving receiver intermod performance and selectivity or reducing the PLL synthesizer's phase noise.

What improvments would I like to see on good CB or 10M rigs?

- A synchronous detector in AM receive for better weak-signal work.

- At least a dual-conversion superhet not only for AM/FM receive modes but also for SSB (i.e., product detection done after 455kHz 2nd IF). Triple-conversion may even be better for selectivity (although not necessarily for dynamic range). Many of the radio block diagrams I've perused seem to only have single conversion for SSB, w/ product detection (SSB demod) occurring at 10.695MHz.

- Various bandwidths of *crystal* filtering at the 1st & 2nd IFs. Should have AM narrow, AM wide, SSB narrow, SSB wide and even a few narrower positions for CW.

- Variable passband tuning of IF so that offending junk on the side of a signal can be positioned outside the IF passband.

- Low-noise design in receiver front-end. Some triple-conversion HF rigs apply the input signal directly to the 1st mixer (without being run thru any RF amp stage) for better noise performance.

- Use of a multiloop PLL frequency synthesizer. Single-loop PLL synths with small channel spacing steps (say,

10kHz or below) and simple phase detectors create an elevated noise floor that surrounds, if not buries, a weak signal. (It's even worse in crowded conditions.) Smaller step sizes (1 kHz or less) are even worse! Instead the main PLL should have large step sizes and be mixed with or driven by signals from another PLL or DDS (direct-digital synthesizer). Esp. for a single-band radio, a CPU-controlled DDS driving a PLL synth like an MC145151 or '171, set up with large steps in the main synth loop, would be great.

- Main tuning knob operates at finest frequency resolution of say, 1 or 10Hz. Separate, switchable RIT and XIT controls should be available.

- A PL (CTCSS, Private-Line, etc.) tone encoder should also be included on 10M ham rigs for repeater work (hear that, Radio Snack?) Memory channels should have ability to store unique PL tone values for each channel.

Anyways, that's my a-bit-more-than-two-bits.

In some ways, we're fairly close to being there. After all, a relatively frill-free multiband rig like an Alinco DX70T or a DX77T (both got pretty good reviews in QST) goes for as low as $550 to $650 depending on dealer, sale, and version/options.

The cause in most cases is the amp is being over driven. To High a dead key feeding the amp will cause one to burn up faster then anything else. I have had a couple of 667's and never had a problem with the variable, but I never fed them over a 2 watt dead key either. I have found that they swing alot better with the lower dead key as well.

Subject: Pissed off

Coming into the bar and ordering a double, the man leaned over and confided
to the bartender, "I'm so pissed off !" "Oh yeah? What happened?" asked the
bartender. "See, I met this beautiful woman who invited me back home, and
we stripped off our clothes and jumped into bed and we were just about to
make love when her goddamned husband came in the front door.
So I had to jump out of the bedroom window and hang from the ledge by my
fingernails! "Gee, that's tough !" commiserated the bartender.
"Right, but that's not what really got me irritated," the
customer went on. "When her husband came into the room he
said, 'Hey great! You're naked already! Let me just take a leak'.

And damned if the lazy son of a bitch didn't piss out the window
right onto my head?" "Yeech!" the bartender shook his head. "No
wonder you're in a lousy mood." "Yeah, but I haven't told you what really
really got to me. " Next, I had to listen to them grunting and groaning and
when they finished, the husband tossed his condom out of the window. And
where does it land? "My goddamned forehead!" "Damn, that really is a drag!"
says the bartender. "Oh, I'm not finished. See what really pissed me off
was when the husband had to take a dump. Turns out that their toilet is
broken, so he stuck his ass out of the window and let loose right on my
head!

" The bartender paled. "That would sure mess up my day." "Yeah, yeah, yeah,
the fellow rattled on, "but do you know what REALLY REALLY REALLY
pissed me off? When I looked down and saw that my feet were only SIX inches
off the ground!!

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN.....

Coax quality, connector installation, brand of connectors, Unun
installation, ground screening, height above the utilities (no, they are not
below ground... Typical on-the-pole utes here), directional antenna (I run
a beam antenna), etc., etc., etc.

It is not hard, but not easy, either. If you know what you are doing, it
only takes legwork to make a good installation that keeps you, and the
neighbors happy.

Incidentally, their was one houses phones I was tearing up at 500 or more
watts.... Replaced one phone, and that solved that problem.

Nope... the amp is fairly new and unused and the jacks are in
good shape. Plus, the interference is present when plugging into any of
the input jacks--main, stereo, aux, and even on the XLR mic jack,
although it's not nearly as bad when using the XLR jack. Thanks though.

If you only want to volt the final, then you cut the DC collector modulated feed (this is what supplies DC to it on SSB also) and put a choke in line and run a seperate lead out the back for the higher volts.

That is the easiest.

Now, if you want the best, I would run a regulator in the radio (3A would be fine) after the hash choke and use that to supply the rest of the radio, and use the higher voltage produced to run the final.

Sean was talking about the individual pairs of transistors...

In that case, where one transistor is on, and the other isn't, you really
see an imbalance, begin to burn up combiners, etc., etc., etc.

Yes, It can be hit or miss at a hamfest, you may be able to get one if there are any around for that cheap you may not even see one at a years worth of hamfests, You also must consider most hams i know don't sell a 1300.00 dollar item for only 300.00 but i am not saying that it doesnt happen. I would wonder what shape it is in as well. With the dave model you can also run your analog meter with the digital watching both dig or analog at the same time.

yes, very true Sean. but this is his own design /version of a digital
readout same functions different look and style. Just something else to
offer the people as technology is expanded.

My personal fav is the DZ 302 as fitted to the 67-69 Camaro (Z/28 only). This is a solid lifter engine with 11:1 compression out of the box. They used a chamber-style exhaust. The sound of this engine is very unique. It will run an easy 14. Probably faster if fitted with the factory traction bars and cross-ram intake (mine not so equipped) or speed-shifted. The '60s Z/28s were built for speed and could not be ordered with automatic trannys or air conditioning - quite unlike what I call the disco and heavy-metal era models of the '70s & '80s which were merely cosmetically made-over sport coupes.

First, I would inspect the guitar input socket for wear. Is the plug "crunchy" when you wiggle the guitar plug in it?

Actually, it is slightly sharper filtering and a slightly different
de-emphasis curve. (The pre-emph on the Tx is slightly different too, if
done properly). Every FM CB I've seen is phase modulated anyway.

> Given the current state of CB radio where AM transmitters are modified
> to the extreme, can you imagine the temptation to "peak" the deviation
> on an FM rig? We're talking wide-band here!

That's the beauty of FM. The wider the deviation, the less distance your
signal travels. Also, the squelch circuit of the person/people you are
talking to will tend to mute an over-deviated transmitter.

> While I fully agree that FM has advantages, such as better audio,
> capture effect, less interference from static and other noise, I can
> see many problems if FM were allowed on the same channels as AM.

Where've you been? :->

Anyone in the San Diego area:

I was over by the Old Town rail station recently and kept hearing a loud beeping noise that repeated itself at 10 second intervals. Anyone know what this is? It's only when I'm over by there - was wondering if it might be from something going on over at the Lockheed Martin facility next door to the station.

I don't know how all you guys with the "Big Stuff" get away with it. You must all live in the Swamp or 50,000 miles from nowhere. I used to run a 1kw box here at the house in central PA in a populated area, with a Moonraker 4 at 60 ft. with a clean radio and the amp was clean. Never ran till after midnite or selectively during the day, and I still had people beating on the door. One instance in particular someone I knew was eating in a resturant with music coming across the PA system and they heard me shootin' skip over the music TWO MILES down the road. After that report I shut her down.

900 dollars?? your NUTS.. that rig doesnt have the auto ant tuner its not worth 900 bucks.. the mod thats very easy. it takes more time to take it apart and put it together.
That rig goes for with ant tuner about 800.....wish you luck maybe some sucker will buy it.. and the AM sucks the big one on the rig

*> what?
*
*The biggest difference is the 2600 can't be modified for eleven meters
*(CB band) unless you change the PLL. It does not have a roger beep,
*does not have P.A. It does have a repeater offset switch and a switch
*to turn the RIT off and on. The 2600 also has fewer wires under the
*hood. There are also some small refinements in the overall design.
*
*I have put a Chipswitch in my 2600 and it covers 24.8-30 MHz. It also
*adds a bunch of other stuff like memories. I unlocked my Chipswitch
*with a password and it will dial down to 20.9 MHz, but the VCO will
*let go around 23.5 MHz. I tried playing with the VCO to broadband it,
*but I just don't have the time anymore. If there is anyone else who has
*fixed their VCO to lock in the 15 meter band, I would like to talk with
*you about it.
*
*Harry
****

There is little or not design improvements to the 2600 over the 2510. In addition to the differences that you mentioned, the micro-computer used has defferent firmware in it. That firmware can due some interesting things on it's own. Though you must have the original chip in the PLL.

For CB radios and CB radios marketed as a 10M radio they are all about the same. Not much difference between them. That even includes the Unidens designed quote/unquote for the 10M band. IF they use a bipolar transistor inthe RF amp and/or first mixer then they all have basically the same performance.

*Tested this one. It's good. The Grant XL is more selective and every bit as
*sensitive. Of course, the GrantXL isn't a 10/11m radidio. Someone mentioned
*the old Grant. I'll agree here too. I think you'll find that single conversion
*SSB receivers are superior to dual or triple. Once again, more isn't
*necessarily better.
*
*MC
****

The biggest problem with multi-conversion receivers are the design of the mixer stages. In order to get good dynamic range the mixers need to be doubly balanced to start. But with good design the performance of a dual or triple conversion receiver can equal that of a single conversion. Now the single conversion will cost less though.

Boredom has finally set in. I have decided to make a change to my mobile. I would like to put my proven Grant XL on stand-by (not 10-7). I'm looking for a new radio to play with. Since it is possible to make almost any radio talk, I need one that has good ears. The 2510 seems to be the front runner. The problem is they are no longer in production. Are there any new radios on the market with comparable RX performance?

The finals get about 3.8v to them factory. Applying 13.8v directly to the final of that radio would be the equivalent of charging your car battery at about 40v. Not a wise idea. Maybe about 6v.

Thanks - Are you originally from the San Diego area? I'm new here - and
am gradually realizing that the terrain is not always conducive to
mobile reception. I get pretty good reception inland, but when I go
West and I pass behind the ridge on Point Loma, it's like a blackout
except for a few chatters in OB, MB, and PB.

1817. Forgot to mention.....

Newsgroup: rec.radio.cb
Date: 1999-12-15 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <bTH54.534$A%2.52468@news.corecomm.net>
Source record: 15289

Texas are still my favorite "out of the box" amp by a wide margin. For the average user, they are an excellent design and provide day in and day out service. Sure, there is room for improvements, but they work FAR better, more reliably and more consistently than any other "mass produced" piece that i have ever seen. I just wish that their "high drives" were real high drives. Sean
>

Sean wrote in message ...
Adding bias reduces switching distortion, making the amp much cleaner to begin with. The majority of "no bias" amps typically run into problems in this area due to the different levels of "gating" involved and their various gain curves. The more pills involved, the bigger the variance and the problems. With no bias amps, one transistor might be fully on while the other is on the edge. Talk about an imbalance in output !!!

As to the Blue Faces, they are the same ones. I have had MAJOR problems with the 450's and don't recommend them at all. All of those amps use little "weasely" relays that don't hold up well. This is not to mention the complete lack of quality control. I have had brand new amps come in that had parts that were not soldered in, pills that were not properly seated, etc....

If you want to see these amps get REAL squirrely, put a metal lid on them instead of the plastic lid. There's a reason that Otis went to the plastic and it wasn't strictly a matter of economics either. I know that Dennis has experienced the same problems that i have (not that this means i am right and your wrong).

I used to like the blue faces before they were known as blue faces. That basic design has been around for a long time. Sean
>

Bill Eitner wrote in message <38570B44.30BF4371@netzero.net>...
Sean wrote:

> Your observation about amps with bias going into oscillation is right on.
> The bias adds stability to the amp.

I find just the opposite. Bias increases the small signal
gain. That increases the amplitude of the harmonic and
parasitic content.

> If it still oscillates, it is a REAL
> piece of junk or severely out of tune.

In my experience, reducing the bias reduces the level
of "garbage" in the output signal when an amp is
somewhat unstable. In other words, other factors
are the cause of the instability, and adding bias
just makes it that much worse.

> The little "blue faces" tend to do
> this and have come WAY down in quality over the years.

I've never seen a Blue Face go into oscillation
even when the output SWR is way off. There's a
big difference between instability and oscillation.
An amp that is oscillating actually runs by itself.
An unstable amp has unusually high harmonic and
parasitic levels but will not run without an
input signal. Oscillation is instability taken
to an extreme.

The 200, 250, and 350 XL series Blue Face amps are
overbiased when in the "max" position because the
bias rides in with the input signal and is reduced
right along with the input signal in the lower
output positions. This causes a higher level of
instability than would ordinarily be seen with
lower bias. The solution is simple: either use
a lower output setting (avoid the "max" setting)
or reduce the bias by clipping a leg of (or removing)
one of the bias resistors. The 225s are not over-
biased in their highest output position, and the
450s use a very well done, fully regulated and
adjustable bias circuit where the bias is separate
from the input signal. The 450s can be made more
rugged by reducing the bias. It's a simple pro-
cedure to change them from AB to very close to B
class. There are two bias adjustment pots with
arrow-shaped screwdriver slots in them. When
stock, the arrows point toward the rear of the amp.
Simply turn the left-hand pot to its fully clockwise
position, and the right-hand pot to its fully
counter-clockwise position.

As for the quality of the Blue Face amps, it hasn't
changed in the time that I've been dealing with them.
The Blue Face amps still have the best build quality
I've ever seen in a production (mass-produced) CB amp.

To Sean: If you have access to a digital camera,
we should exchange pictures of the Blue Face amps
that we've dealt with. It seems like you've always
been down on them, and I've always viewed them as
one of the best. It's like we're dealing with two
separate amp lines but calling them by the same name.

1818. general observations

Newsgroup: rec.radio.cb
Date: 1999-12-15 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <HPH54.532$A%2.51965@news.corecomm.net>
Source record: 15290

Adding bias reduces switching distortion, making the amp much cleaner to
begin with. The majority of "no bias" amps typically run into problems in
this area due to the different levels of "gating" involved and their various
gain curves. The more pills involved, the bigger the variance and the
problems. With no bias amps, one transistor might be fully on while the
other is on the edge. Talk about an imbalance in output !!!

As to the Blue Faces, they are the same ones. I have had MAJOR problems
with the 450's and don't recommend them at all. All of those amps use
little "weasely" relays that don't hold up well. This is not to mention the
complete lack of quality control. I have had brand new amps come in that
had parts that were not soldered in, pills that were not properly seated,
etc....

If you want to see these amps get REAL squirrely, put a metal lid on them
instead of the plastic lid. There's a reason that Otis went to the plastic
and it wasn't strictly a matter of economics either. I know that Dennis has
experienced the same problems that i have (not that this means i am right
and your wrong).

I used to like the blue faces before they were known as blue faces. That
basic design has been around for a long time. Sean

Sean wrote:

> Your observation about amps with bias going into oscillation is right on.
> The bias adds stability to the amp.

I find just the opposite. Bias increases the small signal
gain. That increases the amplitude of the harmonic and
parasitic content.

> If it still oscillates, it is a REAL
> piece of junk or severely out of tune.

In my experience, reducing the bias reduces the level
of "garbage" in the output signal when an amp is
somewhat unstable. In other words, other factors
are the cause of the instability, and adding bias
just makes it that much worse.

> The little "blue faces" tend to do
> this and have come WAY down in quality over the years.

I've never seen a Blue Face go into oscillation
even when the output SWR is way off. There's a
big difference between instability and oscillation.
An amp that is oscillating actually runs by itself.
An unstable amp has unusually high harmonic and
parasitic levels but will not run without an
input signal. Oscillation is instability taken
to an extreme.

The 200, 250, and 350 XL series Blue Face amps are
overbiased when in the "max" position because the
bias rides in with the input signal and is reduced
right along with the input signal in the lower
output positions. This causes a higher level of
instability than would ordinarily be seen with
lower bias. The solution is simple: either use
a lower output setting (avoid the "max" setting)
or reduce the bias by clipping a leg of (or removing)
one of the bias resistors. The 225s are not over-
biased in their highest output position, and the
450s use a very well done, fully regulated and
adjustable bias circuit where the bias is separate
from the input signal. The 450s can be made more
rugged by reducing the bias. It's a simple pro-
cedure to change them from AB to very close to B
class. There are two bias adjustment pots with
arrow-shaped screwdriver slots in them. When
stock, the arrows point toward the rear of the amp.
Simply turn the left-hand pot to its fully clockwise
position, and the right-hand pot to its fully
counter-clockwise position.

As for the quality of the Blue Face amps, it hasn't
changed in the time that I've been dealing with them.
The Blue Face amps still have the best build quality
I've ever seen in a production (mass-produced) CB amp.

The JB 2000 was the one that had the driver tube in it. The model that used only the two 3-500's was the JB-1080 and had a band select switch on it.

You would be REALLY surprised at what a clean Black Cat two tuber will sell for. WAY more than what you think. At $350 with fresh tubes, i would take ALL of them that i could find. Sean

> worth about $350 with mint tubes...
> ....

There was another JB2000 that used a pair of 3-500's and had a small driver stage tube also. I forget the driver tube number but it allowed a low power rig to drive the amp to hi output.
The transformers in these were pretty light duty so don't leave it keyed at full output very long.
I'm afraid I've been out of the CB stuff too long to be able to give you a recent price on one of these.
BobC.

It appears you are using Outlook Express.... Do this from Outlook Express:

Tools
|
|
Options
|
|
"Send" Tab
|
|
"Settings" beside "Plain Text" under "News sending format"
|
|
"Automatically wrap text at ###" Try to set it from 70-76

Thats about it... that is IF you are using Outlook Express v.4.72.31 +

Take care.

Hank

Well, I just had to add my two cents. A long time ago (1968) I was running a Utica TC3 into an 80W amp with a super-magy omni on my roof. Clean, yeah probably but what you are all missing in one little known fact about AM and simple detection of AM. ANY bi-polar or bi-metal device can become a simple AM detector! Even a phonograph (the vinal type for you young punks that never saw a vinal record).

The next day after the linch mob was gathering outside my front door, I decided to dismantal the entire setup. The FCC was a bit more active in those days. For the record, I was heard over telephones (60's vintage, not this new electronic wireless stuff), phonographs (vinal record types :-), AM radios, and TV (first harmonic of 27MHz is right in the bandwidth for TV channel 2 I think; I guess I wasn't that clean :;)).

Anyway, does anyone remember those little plastic radios with an earphone connected to a device with only a 3" antenna, and no batteries? You tuned it by moving the wire up and down out of the device. If the broadcast radio station was stong enough, a simple diode was all that was necessary to detect the singnal. You don't even need a diode either. With enough power, a solder joint joing two dissimilar metals inside a phonograph will do the trick.

John

Thought you might find this interesting.

Where have you put your antenna? Have you tuned your antenna? Where is it with respect to your car radio antenna? What have you attached the power leads of the radio to? What condition is the electrical system in your vehicle in?

I'll go along with this. For those that don't know, this is an active means of demodulating an AM signal rather than a passive one. Very useful if the station you're working is getting their signal severely twisted and faded by the propagation conditions.

> - At least a dual-conversion superhet not only for AM/FM

I disagree. It is commonly held that single conversion receivers are the best for SSB work. The selectivity is accomplished entirely by the Xtal filter. So profoundly so that additional conversion stages can only add noise. If more gain is required, to make it more sensitive, this can be easily addressed without adding another stage of conversion.

> - Various bandwidths of *crystal* filtering at the 1st &
> 2nd IFs. Should have AM narrow, AM wide, SSB narrow, SSB
> wide and even a few narrower positions for CW.

I guess we are talking about those 10m rigs here really. To my knowledge, SSB is narrow-band by default so I see no point in making it narrower. I do agree that some SSB receivers have less than excellent selectivity though. I've never heard of narrow-band AM. Given that the the average bandwidth is going to peak at 6kHz, I believe it prudent to have the filtering designed with that in mind. If it were SW broadcasting that you are into, them I could justify a slightly wider filter. I don't believe that there is any broadcasting in this part of the spectrum. Well, there is in a sense but let us not go there right now. :->

> - Variable passband tuning of IF so that offending junk

> for better noise performance.

There are different schools of thought on Rx design. The best all-round I've seen is moderate amplification, heavy filtering and then mixing down with relatively little filtering.

> the main synth loop, would be great.

A man after my own heart. The MC PLL ics aren't inherently inferior - but the loop filters in them are. I've worked on a design where we created an elaborate loop filter outside of the circuit and achieved admirable performance. Were able to cover copious range with the VCO with fabulous noise figures. The design of the VCO was very critical though. If you use a dual-modulous prescaler you can pump data into the PLL that can make use of a lower /R ratio thereby pushing the phase noise higher in frequency - and consequently lower in amplitude. This becomes a software issue now.

> - A PL (CTCSS, Private-Line, etc.) tone encoder should
> also be included on 10M ham rigs for repeater work
> (hear that, Radio Snack?) Memory channels should have
> ability to store unique PL tone values for each channel.

Make that Encoder/Decoder. The last time I checked it was 1999, it's about time this kind of thing should be standard equipment. You'd be hard pressed to find a professional two way radio nowadays that didn't decode/encode CTCSS/DCS (PL/DPL) in stock trim. If you did, you wouldn't buy it because invariably it would be crap.

> In some ways, we're fairly close to being there. After all, a

> DX77T (both got pretty good reviews in QST) goes for as low as
> $550 to $650 depending on dealer, sale, and version/options.

These are two different markets. Much development cost can be justified on creating hobbyist (ham) equipment. Look at how many of the features of yesteryear are now defunct. This is especially true of the likes of Kenwood, Icom and Yaesu/Vertex/Standard(now). All these companies have professional products with much higher margins and lower build costs

that incorporate some of the features trailed on the ham gear.

CB radios are cranked out like dung through a goose in some Chinese sweatshop by some poor slob who makes $3 a day. Incorporating all the lowest cost parts imaginable. If you think that the margins in CB radios are low, carefully study the financials of Uniden. I think you'll be very surprised.

MC is late for dinner - bye!

It is illegal all right. I thought 46- 49.999 corless phones were illegal to monitor too.
NOT?
Cordless phones require a better antenna to pick up with a scanner. A piece of coax with a pin on the end to stick ito the rubber ducky scanner antenna works wonders.
Cell phones are cool. A lot around 882.400. You can pick them up from a greater distance but can only follow for a short while. The antenna towers switch off the signal as the cell phone moves from one to another tower.

Source record: 15139

: MC 10kW Jesus <qsl27@hotmail.com> wrote:
a lot of bull mostly..

: Thankfully, Tim, the days of hashy switching power supplies are winding
: down.

I don't think so... they're made in larger quanities every day... Analogs
are on the decline.

: If you stick to a reputable brand name, that is to say not a "hobbiest
: quality" one, you should be in good shape. Switching supplies generate
: maximum noise when they are generating maximum current.

And just what kind of noise is that..? A properly shielded quality power
supply won't be heard in your receiver... at all.

: In your case this'll be Tx. The hash noise is very
: unlikely to have any effect on your transmission. It is the noise from the supply
: getting back into your Reciever that will cause grief. I like Astron linear power
: supples, but I don't trust them to make a decent switcher. I repaired one the other

Astron Supplies are over rated for continous output at the full value.
Anyone who uses an analog Astron needs to de rate it in continuous
service... more than the manual states.

: day that used a 556 timer for the switching function and the threshhold of
: conduction on an NPN transistor for the "reference". It works, but this design is
: about 20 years out of date now. I would recommend something from the
: folks at ICT.

What have you designed that would replace it... How old is that analog
design you prefer..?

: Very good value, reliable, specifically made for two way radios and they have
: models for all the current you'll ever need - up to 100A.
: I am not affilated with ICT in any way.
: MC

Get a quality switching supply, shield it properly and enjoy a great
reduction in heat, and your electric bill.

It's those crappy rubber ducks. You can't cram a cb antenna into that short of a package and expect it to work worth a damn.

I have a Midland 4 watt handheld that is easily outdistanced by my FRS radio. But connect an external antenna, and it's a different story.

TNT's typically have horrible crossover distortion and stability problems. The latest ones are REALLY bad. Input swr has gotten even worse with them. Had one guy come in with a BRAND new 600 + a few weeks back that kept taking out radios. The swr going into the amp never dropped below NINE on any stage. 4 watts in gave me slightly over three watts reflected at best case !!! So much for quality control before it went out the door.

As to the 450 XL's. i had one come in today. It was a piece of shit. It showed me appr. 400-425 watts pep at 14.5 volts including horrendous amounts of parasitic oscillation. It is not uncommon for me to see bursts of appr. 7 - 800 watts out of these amps at times. When i was finally able to get the amp somewhat stable, it was producing about a real 200 watts pep. Pretty pathetic for an amp using 4 Moto 454's from the factory (in my opinion). He left the amp with me for further repairs. I'm sure it needs a lot more time and TLC than what i briefly gave it today. I would like to hit it with a hammer :)

The scariest thing about this is that the guy was using this to drive an 8295. This in turn drove two 6000's. Talk about a horrendous splatter box.

Between guys amplifying the JUNK that is coming out of their radios / drivers to an even greater extent and amps with horrible input swr's that cause the radio to become unstable and oscillate / produce harmonics, It's no wonder why civilian's complain about TVI and interference.

Not only should the people that build this crap be "corrected" but also the crooks and idiots that pass this type of stuff off to customers as being good quality. It's the mobile stuff like this and the "Varmint" type base amps of yesteryear that have created most of our problems. Combine this with a horribly inept installation (base and / or mobile) and you have nothing but complaints coming our way. I can understand why people get upset. Sean

.....snipped.....

> Cleaner as far as switching distortion, but not cleaner
> as far as harmonic and parasitic content or AM audio

> signal quality since there is no information being
> conveyed at the crossovers.

BobC writes:

There is a time when the rigs' carrier is going to be off during modulation when not limited to less than 100%. negative modulation. Not unlike SSB, when the drive gets below the turn on voltage of the finals there will be no conduction in the transistors. When the drive starts to rise, it must pass this breakover voltage to get the transistors conducting again. At this point you have crossover distortion as Sean said.
So, in essence, there is a part of the information lost in the crossovers when not biased right.

Yes, It can be hit or miss at a hamfest, you may be able to get one if there
are any around for that cheap you may not even see one at a years worth of
hamfests, You also must consider most hams i know don't sell a 1300.00
dollar item for only 300.00 but i am not saying that it doesnt happen. I
would wonder what shape it is in as well. With the dave model you can also
run your analog meter with the digital watching both dig or analog at the
same time.

The Heath's used bigger transformer's as a general rule and would take more of a beating. The Black Cat's used whatever transformer that they could find at surplus prices. As such, consistent performance was not a strong point for these models. As Toll stated, a 400 watt carrier would give extremely long life to the tubes and amp. I would not push it to beyond 600 watts D.C. and expect it to last a real long time.

In terms of pricing, I have seen these go for well in excess of $1000 USED !!!! Dick Maresh (the original owner and founder of Wawasee) used to get $1200 out of some of these that Dennis had worked on. Dick had his Pilot's license and would fly in from Syracuse to pick them up and drop them off at Dennis's house. At that profit margin, he didn't mind making the trip !!!! Sean

Toll Free wrote in message ...
The transformers are rated at .6KVA, so keep the carrier in the 400 watt level, and they will last forever..

Same thing with the SB220 and 221.

1848. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.cb
Date: 1999-12-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <83a422$73j$1@news.hawaii.edu>
Source record: 15147
Cross-posted to: rec.radio.broadcasting,rec.radio.cb,rec.radio.info

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Nothing to wonder about, Boo. 123 is no longer the "prime mover" in the X-Force camp from what i have been told and seen. The latest products reflect that also.

As the Highlander movie and TV series states: " There can be only ONE". That would be the original. Dave Made. Sean

As everyone else stated, Texas Star does not make a REAL high drive amp.
This is regardless of what the name says. Keep the carrier low and the
variable wide open. Sean
>

prozac 625 wrote in message ...
My friend Just called me with a Texas Star 667 and he said the Potentiometer
is burning up. I have no way of looking at the amp but if any one know of
the cause?

Toll Free wrote in message ...
If you only want to volt the final, then you cut the DC collector modulated feed (this is what supplies DC to it on SSB also) and put a choke in line and run a seperate lead out the back for the higher volts.

That is the easiest.

Now, if you want the best, I would run a regulator in the radio (3A would be fine) after the hash choke and use that to supply the rest of the radio, and use the higher voltage produced to run the final.

Toll Free

I was bored one day and started playing around with an old scanner I
have. I noticed that I could pick up cordless phones without
interference at a distance of a couple blocks with the rubber duck
antenna. Hooking the A-99 60 ft up in the tree in my back yard to it
increased the distance to a couple miles. The problem was that it was
hard to listen to an individual call for very long because if a
stronger signal came in on the same channel, it got wiped out. The
same afternoon, I happened to hear my neighbor's wife on their
cordless phone. It had been speculated by us and the neighbors on the
other side of the house that she had been cheating on her husband with
a guy that lived a block down the street. I just happened to pick up
her call to her best friend, confessing the whole thing in very
graphical detail. The very next call that came through after she hung
up was the wife of the guy she was screwing around with calling her
Mother and telling her that she had found out about it and had kicked
the guy out of the house. Very interesting to say the least. My wife
and I had to act like we knew nothing about the entire situation
whenever the subject was brought up by one of the neighbors...

Still for sale Midland 79-290 am/ssb moble radio. I have the box, Manual, Power cords, Mounting bracket and Mic. This radio is in Excellent condition and in 100% working order. $75.00 (Plus $6.00 shipping for lower 48 states) no cods money orders only.

1857. Re: Antron99 or IMAX2000?

Newsgroup: rec.radio.cb
Date: 1999-12-16 00:00:00 UTC
From: station53@webtv.net
Message-ID: <53-3858E23D-3@storefull-285.iap.bryant.webtv.net>
Source record: 15306

I've had several 99's and the Imax, and I like the Imax 2000 much better on performance, plus I give no TVI. Be wary of generic antron 99's, however, calling themselves the "A99", instead of "antron 99" you can tell the difference by the the much cheaper price of the "A99", and believe me, you get what you pay for. But i still say the Imax 2000 is the best.

Sean,

I'll put Matt out of his misery.

He's possibly seen one on US tarmac but didn't realise what he was
looking at.
>What's a Pantera ???? Trust me, "my son". You have a lot to learn !!!!
>Sean

> Whats
>a pantera? Is that a overseas car?
An American Italian hybrid.

Designed by a Mr De Tomaso, an Argentinean based in Italy, bodies built
by Ghia engines supplied by Ford, your very own 351C.

This was mated to a 5-speed ZF transaxle as the engine was mid mounted
and drove the rear wheels.

It is an awesome sounding motor and AFAIK is/was holder of the title for
the 'loudest' production car. The road shakes beneath it.

Most went to the US and were fitted with those awful 5mph bumpers unlike
the Euro versions.

If you want to see some pictures there's plenty on the net. Just search
on 'pantera'.

Built my first diode detection at age 9.

A germanium diode across the two pins on the rear of a telephone handsets earpiece and the outer shield of the TV antenna's feeder connected to one of the pins.

No tuning of course.

This was before the UK woke up to pop music broadcasting save for R. Luxembourg.

The station I heard and listened to most nights was the offshore pirate Radio Caroline. They had one of those CH6 rigs, a RCA 50Kw Ampliphase transmitter down in the hold and a full-size 5/8 antenna tower up on deck. Tallest tower ever fitted on a sea going vessel. The tx is still in the hold to this day, but on a different boat.

I Have A President Madison With Matching Speaker And A D104 For 250.00 OBO
Plus Shipping
This Is The Radio With A Clock And Alarm Etc. Same Board As The Cobra 2000
This Is A Big Radio In Size Has AM USB LSB
The Radio Is Very Clean And Has No Problems.
Clarifier Is Still Locked
The Frequency Mod Was Done But Is Disconnected At This Time.
Radio Has Full Output Plus.
73's

Exactly! No matter how "clean" YOUR station is, with enough RF floating around, you're bound to cause havoc with some cheap consumer electronics. Computer speakers are a good example. In order to eliminate interference, you have to do something to the problem device. Which can be a can of worms should anything ever happen to any neighbor's device that you "worked" on. Which is why I refuse to do it.

I gave up with my interference problems. I resolved myself to running 100% legal, with as clean equipment as possible. If there was still a problem, then call the FCC. I'm not going to take the brunt of some 3rd world country's design flaws.

As long as people buy those cheap phones at Radio Shack, and have a houseful of other electronic widgets, you'll have no end to problems with interference complaints.

I'm hoping that my new location fares better. We have underground utilities, I'm running the coax underground to the antenna (in conduit), and still running legal power. Time will tell once they finish building all the new houses around me.

A lot has to do with what frequencies you are running. I have a ham
friend that can run 1 KW on 80 and 40 meters, and not bother anyone. But
run 100 watts on 10 (or 11) meters, and he destroys the neighbors.

A "clean" CB should be no more prone to RFI than your Kenwood.

Who needs "Melrose Place" when you have a scanner? My neighborhood phone
traffic was no less juicy at times. Teenaged girls talking about their
first time with sex, wife talking to newly found lover while hubby
watched Monday Night Football in the next room, guys making drug buys,
and even caught one neighbor bitching about ME and all my "radio stuff"
to another.

It's fun to try to figure out who all those voices belong to. Sometimes more entertaining than TV, becasue it's REAL......

> knowledge, SSB is narrow-band by default so I see no point in making it
> narrower.

Big point. Narrower bandwidth equalls less interference and less noise,
resulting in better sensitivity. Most ham rigs have a "nromal" filter of
2.5 - 3 Khz and a "narrow" filter of usually 1.9 Khz. The audio fidelity
is much more muddy sounding, but your ability to copy the station
through the noise and adjacent interference is greatly increased. Notch
filters also help to remove adjacent signals

> I do agree that some SSB receivers have less than excellent
> selectivity though. I've never heard of narrow-band AM. Given that the

> the average bandwidth is going to peak at 6kHz, I believe it prudent to
> have the filtering designed with that in mind.

Normal communications quality AM is 6 Khz wide. Narrowing the bandwidth to 4 Khz, will accomplish much the same as it does for SSB when you use narrower filters, namely an increase in signal/ noise ratio. The tradeoff, as with SSB narrow, is reduced audio fidelity.

> If it were SW
> broadcasting that you are into, them I could justify a slightly wider

This technique is just a more flexible implementation of the narrow filter concept. When both are used, the results over not having the capability is awesome.

>
> > - Low-noise design in receiver front-end. Some triple-

> down with relatively little filtering.

For optimum noise figure, the first device in the chain must be a high gain, low noise device. I subscribe to the school that says to amplify early, to avoid generating interstage noise with additional IF sections. Having a low noise RF amp gives you the best noise performance. The down side is subceptability to front end overload and desense. That is why it should be switchable.

You'd be surprized at how many VHF ham rigs that STILL don't offer CTCSS decoding as standard equipment. Encoding is usually standard though. I'm also surprized that more rigs aren't offering DCS. It's not exactly brand new....

I've recently "inherited" a Galaxy DX-55V. I've had mostly Cobras, a couple of Unidens, and a couple of Realistics during the course of my 9 years in the hobby. Of the three, I've been impressed with the Cobras most of all. I'm not very familiar with the radio though I've heard of the name. Would it be considered a keeper?
It has been peaked and tuned which is something I've never done or had done to any of my previous radios.
I installed the radio in my pick-up to try it out and after checking modulation, wattage, and SWR I found that at 6 watts dead key the unit will swing 27 watts at full modulation. I also found that the SWR was higher with this radio than with the Cobra-29LTD, relatively speaking. With the Cobra, my SWR reads 1.2:1 on channels 1 & 40 while with the Galaxy, my SWR reads 1.8:1 on channels 1 & 40 (same frequencies). I'm using a Doczy DE-1000-3. Any ideas on why the difference?

Prob. due to the diff. in output power. Also the Galaxy may be tuned diff. from the Cobra due to the several bands of channels and not matching up as well to your antenna which is more than likely set for the regular 40 channel band. Even though you are on the regular 40 channels when you test the swr, the radio could be peaked for another band causing the higher swr. Not enough diff. to matter.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 40.00 plus shipping.

A Picture can be e-mailed.

Source record: 15346

I have a new Palomar 225 blue face. The other day I had it on high for the first time and got a report that I was squealing. I played around for a while and found out it only squealed when my headlights were on, it was raining. It only squealed when in high. I have the amp wired with the accessories under the dash. SWR was good when I hooked it up last week. I don't know what caused it. HELP!!!

what the hell good is it to have a varable pot if ya can,t have the amp keyed and turn it to wach your watts on the meter . i think some one should put a super heavy duty pot in there ...thats my 2 cents

1899. Increasing forward B+ voltage shift

Newsgroup: rec.radio.cb
Date: 1999-12-16 00:00:00 UTC
From: Joe <efjoseph@asacomp.com>
Message-ID: <83bmcu$6ht$1@news.asacomp.com>
Source record: 15348

I want to know how to increase the B+ forward voltage
shift on the collector of TR-51 during modulation in AM mode.
I have measured this voltage several times during my explorations
of this circuit and have found that during an dead key no modulation I
measure @ 4vdc, when the tx is modulated the voltage shift
increases @ 2.5-3.0 vdc on the collector of TR-51. total
of 6.5-7.0 vdc is applied to TR-44 collector.. I would like
to inccrease this voltage shift to TR-44 during modulation
to @ 10vdc. total. that is to say from an dead key voltage
of 2.5-3.0vdc to 10.0vdc forward shift when modulated.
does TR-49 have to be modified for this to happen?.

more to come.

Regards.

That's the hard part--pretending not to know. I had a similar thing occur. I was on the same channel with a cheating housewife/neighbor. She lived on the street behind my house. When I was out in my shop at the rear of my lot, her "base" covered up mine and I could hear both sides of the conversation via my handset.

I've since moved, and I upgraded to 900 MHz, so I can't give you "The Rest Of The Story".

The problem with that bill is that it will render the legal 4 watt CBer at risk of being harrased by local law enforcement. A 4 watt CB can cause interference with all the cheap consumer electronics products around, and more on the way since we love China so much, that local munincipalities will use this bill as a springboard to issue cease and desist orders to legal CB users who are causing interference. The consumers will win in the end with this bill. Not to mention the ability for police to use the mobile antenna as an excuse to pull a person over and check their transmitter for type acceptance. But, we know the real reason that they will be pulling the person over, they may just not like the way the person looks. This will go for hams too. Of course if your legal you have nothing to worry about with regards to your transmitter, but you are now the subject of indiscriminant harrasment.

Sean, I had busted this story a few months back and not many believed me, and as they say " the truth will set you free", well it shoud set many souls free now. and to all the sorry suckers who denied it remember this you heard it hear first baby, I am many things but a liar I am not. It has been said 151 ripped him off well it comes as no suprise to me as you can see the backstabbers will be just that they fucked dave over so what makes you think they would'nt fuck each other over. So who ever wants to get fucked step up to the plate and pucker up because x force is handing out fuckings for christmas.

"Davemade til the End"

If they are on the same cable service he can. It can enter the cable system
and travel the line to many other houses at many miles away. A walkie talkie
can do this if the conditions are right or rather not right with the cable
company's equipment. Poor cables or connectors are usually to blame for
this. Call the cable company to have them fix it.

And what Kind of pot would you call heavy duty? I think it should be like this..... High, low switch and use you variable on the radio. The high low switch will only control modulated output, in other words a switchable input pad, Then use the variable on the radio to control your carrier BUT keep in mind that the resistors you use on your input pad will go just as fast as the pot, Unless they are large enough, you can also heat-sink these resistors, kinda like messenger did with their diodes in their bias circuit, just for added security.

Solar cycle ups and downs continues to mystify scientists - Solar
activity
is picking up, but not as much as one team of scientists had predicted.
"The sun is a variable object and there are going to be some ups and
downs,"
says NASA's David Hathaway. One 'up' he doesn't expect is a large
eruption
predicted nowhere except in the rumor mill. Full story:

Mic wiring: http://www.copper.com/micwire.html

Your freq counter will read right when there is NO modulation. That
may require you to turn down the mic or the mic gain to read it.

Does anyone know if Sams made a set of photofacts for scanners? I am looking for a set like the radio series but I do not know if any of these were ever made. Like a complete volume. If anyone knows if this set was made please let me know how many books were in the set and what the actual series was called. If you have a set for sale or some of a set please let me know. I went to the Howard Sams site and did a search for some scanners that are older and should have been in a book if they ever made any and the Sams search engine came up with nothing. Electra Bearcat 220 and 210 should be in these books if they were ever made but I had no luck. I even went further back to the Electra Bearcat 3 crystal type. Still no luck. I do not want to order each schematic from Uniden as they are not as nice as Howard Sams produce. No test points with voltages ect. Anyone have any info please let me know.
Thanks,
Mike

You might be getting some kind of electrical noise from your hook-up spot. I would run your positive wire directly to the battery and run the ground to a good seperate ground on the body or chassis.

I was about 13 years old when I was introduced to CB by my next door neighbors wife. I used to rendezvous with her after "Mr. Pillar" went to work. She bought me a walkie talkie and I was to turn it on at about 6:00 or so and when the coast was clear I would receive a call from her. This worked very well for a couple of years and no one was the wiser. I moved from that part of town in my sophomore year of high school and the walkie talkie didn't reach her house from my new location so I bought my first CB radio (a globe cb-100). I was back in business, so to speak! The globe came with only one set of crystals (ch 14 to match the walkie talkie channel) but had positions for three. After a few weeks on the paper route I was able to purchase 2 new channels. I purchased channels 13 and 12. Listening to the other channels for a couple of days I was dismayed to find my "woman" in a heated conversation (much like the ones she had with me) with one of my classmates. I never spoke to her again. Years later I found out there were several walkie talkies in our development all with different channels installed... Mrs. pillar was a very busy woman.... I learned alot about radios and other things back then!

I use a T-Stripper made by Ideal. The red handled pair covers 16 to
26 gauge. The blue handled pair covers the bigger wire.

The schematic comes in the user manual.

A foldout blueprint.

It was built in New Mexico.

Good radio, but they are finicky.

If you ever want to sell one, let me know. I had one stolen and I would like to replace it.

> A "clean" CB should be no more prone to RFI than your Kenwood.

Not totally true.

A stock, high level modulated CB radio WILL put out higher power in the harmonics due to the fact that it uses non-linear circuits in the final and driver section and they don't filter them as well as the should.

In a low level modulated radio, all the RF stages are run with bias and cleanly.

No, the correct answer would be twofold...

Run BOTH the positive and negative from the amp to the car battery....

AND

Fix the problem with the ground loops in your vehicle...

You can purchase the same thing from Uniden if you ask them for the one for the Grant.

Cobra says they are no longer available because it is a Uniden part, and they severed ties with Uniden.

If you are using a cable converter, you can usually ask your cable company to give you a different model, if they provide those because the harmonics and bleedover are tremendous on certain converter channels (channel 18 being the case in my city)

1944. Alternator for 8 pill?

Newsgroup: rec.radio.cb

From: andres <aortiz@mail.com>
Message-ID: <s5j8fkj6qrs144@corp.supernews.com>
Source record: 15393

I live in Puerto Rico and I'm bulding a system for my car. I have installed a powerline 150 amp alternator along with my stock alternator to power an amp with 2 8 volt bateries. How big a box could I run efficiently on that setup? I have an xforce 3 pill for a driver. I was planning on running an 8 pill with this setup.

Thanks

Andres

I would say if you dedicated the 250 alternator for that 8 pill, you should be okay..... Should get some decent power out running 16 volts.... You do have your regulator putting out 17.3-17.6 volts right?

The 8950's are used in Siltronix and Swan equipment. They are somewhat hard to find, and usually go for about $75-100 APIECE for N.O.S. tubes.

What is and who makes the "Duracom" power supply? I see references to
them but I have never seen an ad or any specs on the make. I have also
seen it referred to as a "Duracomm."

Thanks.

I agree with what you are saying, wholeheartedly, but what I was saying was that this petition would take it away from land / mobile radio service and turn it to lean towards hobby bands...

You will also notice that their isn't another land mobile service below 30 megs.

Toll Free

Duracomm power supplies are (or was) sold by:

Duracomm Corp.
2119 Atlantic
North Kansas City, MO 64116

The Company is/was owned by John Fuhrman. I believe he is (or was) a HAM. I have one of his switching 22 amp power supplies and it has worked great for me for a number of years and is still in use. When I first got it, it had a lot of noise which I could hear in my receiver. I wrote John about it and he had me send it to him. He totally cleaned it up, and sent it back to me at no cost to me. He is a great guy, and his power supply has never failed me. Oh, the little switching power supply that TenTec used to sell for the Scout was a Duracomm, so I have been told.

I don't know if he is still in business. I have not heard from him in a number of years.

James (Jim) Parsons, K5ROV USAF, Ret. Ham for 58 yrs.

Your 8 pill should do fine with that set-up. Run the radio and driver off of the stock alternator and the 8 pill off of the dedicated high voltage system. You might get away with a 10 or 12 pill, but it would be stressing the electrical system if you were really getting down on it. Just make sure that the box your going to run will handle the increased voltage. Better make sure the antenna system is up to snuff too. Sean

Technicality, but how about the 500? I have one that I'm going to
install when I get around to it (I know that's vague, it's been a
month so far). Is there any point where there is a risk of damaging
the pot in this amp?

Just curious.

Could be several reasons for this. The radio's output stage may be something other than appr. 50 ohms due to hairbrain modifications. These hairbrain mod's might also be causing the radio to produce harmonics (out of band "splatter"). The antenna is not tuned and will not accept the frequencies that the harmonics are generated on and it therefore shows up as a higher swr (increased reflected power). Just guesses though..... Sean

If it has a variable pot on the front, it will not last if you over drive the amp, if you are going to drive the amp with another smaller amp you will need to do away with this pot altogether, But I dont suggest driving the amp without some changes.

Was it base or mobile ???

Either way, it would cost a FORTUNE to re-tube it. I passed on one of these
due to the MAJOR amount of work that needed to be done to it. Unless you
can locate a ton of M2057's or 8950's at a good price, forget about it. It
could be converted to run other tubes, but that's a whole nother story.

If you only knew. Believe me, it doesn't take a million watts either...

We had a local guy sit in front of the Satellite dishes for a local cable company. His audio was transmitted across EVERY cable channel within every community that this specific cable company served. They had thousands of complaints pile in, not only to the cable company but also to the local Village Hall. Yes, it was REALLY dumb and could have brought the FCC around PRONTO. Then again, nobody ever said that cber's were smart or thought ahead......

PS..... PLEASE don't do stupid stuff like this. It will only make matters worse for all of us. Sean

I think one of the reasons the pots lasted on say your m-80 is because he uses a 100 ohm resistor to " absorb" any rf that would normally overload the wire in the pot when you turn them down, although they to will fail under extreme conditions. I do have to say that Dave's variable design is a good one, I have seen a lot of other people copy it, I have used it before as well. damn good design.

Okay "smart guy", you knew what i meant. :)

As it is, i don't know too many other straight 8 pills that a barefoot radio
can drive to respectable peak levels. Then again, this is a tribute to the
efficiency of these amps. Sean

Source record: 15416

SSTV or Slow Scan is used on the HF freqs., but it is also being used on VHF (2 meters) in this area. Some of what has been described here (cable ready gear etc) is for the UHF Fast Scan which is like regular TV, and is usually on 432 mhz and 900 mhz. As for SSTV, you can download a program, use your sound card, and a Shortwave receiver and be able to watch SSTV from the Hams on 20 meters. AS for sending, it will require a transmitter capable of that freq, and another hookup. Search the web for SSTV, and you will find a number of pages which describe it, show pictures of it, and info on the actual use. SSTV is slow, but it is fun.

I don't want to start a pissing contest here, but most AM/SSB radios,
even the high level ones, keep some bias applied even in AM mode.

But even considering what you stated, the radio still has to pass rigid
spectral purity tests to conform with the tech standards for type
acceptance. Harmonic content in any case cannot be any worse than
-60dbc.

If the radio is stock legal, it should be very clean. Of course if the
mod limiter is clipped, and the modulation looks like a squarewave, then
I'd agree that that radio is no longer "clean" and will be putting out
harmonics.

> week. I don't know what caused it. HELP!!!

Three words:

GROUNDING, GROUNDING, GROUNDING.

Most squeals are caused by RF feedback. If the radio AND the amp are
both solidly grounded to the vehicle chassis (and I don't mean running a
6 foot wire and tying it the seatbelt bolt), you sould minimize your
squeal problems.

If you're running a mag-mount antenna, get rid of it. A direct grounded
antenna is much better at preventing "floating" RF than a capacitive
ground mag mount.

1991. Cobra 148 sounds off frequency...

Newsgroup: rec.radio.cb
Date: 1999-12-17 00:00:00 UTC
From: pmunsel@aol.com
Message-ID: <19991217072758.23797.00000001@ng-cl1.aol.com>
Source record: 15419

I have a Cobra 148 that sounds like it is off frequency on receive. Any ideas which coils could be adjusted to get it back? It has just started this, and does not matter if it is warm or cold. It is used mobile, and missed very much. I have played with the clarifier, and it soesn't do anything for it, and I have switched channels trying to see if it was that far off, but it doesn't make a difference. Any help, or diagrams and specs would be greatly appreciated.
Thank you,
Paul Munsel

1998. Cobra 148 GTL ST modification want

Newsgroup: rec.radio.cb
Date: 1999-12-17 00:00:00 UTC
From: Bryan Jarvis <vader1@flash.net>
Message-ID: <t8s64.4143$ht2.354455@news.flash.net>
Source record: 15426

Hi, all.

I have an unusual (?) request for a
modification for my Cobra 148.

In SSB mode, the knob for fine tuning
the receive frequency is too sensitive.
By that, I mean that even a small turn
often takes me past where I really wanted
to go. I'm constantly trying to fine-tune in
on a signal I'm receiving and usually over-
shooting the adjustment.

Is there a way to change the adjustment
rate of this knob?

Thanks in advance,

Bryan

Do you have any Ideal how dumb you look? Or is that the reason you keep changing your screen name. Why is it that the best boxes around are always the boxes some on is trying to get rid of. Man if you where selling Dave Made boxes they would be the best thing around. Get real the only people you may be influencing are the people that don't know better. You might sucker people to buy your products but sooner or latter they will find that they have been burned and you know who they will point the blame at? No not the amp company they WILL point at you.
Keep selling that junk. I see your not worrying about ruining your name since every time you come here you post under a new one.
I don't make money off of my words I speak the truth. Dave Made Doesn't not tell me what to say nor do I get paid for what I say.
I guess my point here is how can you trust an opinion on a guy that only sells select products.

Bite both sides of the burger before you say you didn't get a pickle.....

Please read all of this post.

1. I have a WORKING Realistic TRC-458 which is a 40 channel CB base AM/SSB radio that I am selling for a freind. The radio has some scratches. Has NEVER had any extra channels put in it.
Great radio, as it can do over 200 channels. Info on the net. It has the 858 chip.
Full service manual included (a $ 25.00 value) and a brand new separate 858 chip (spare).
Sell both for $ 75.00 plus shipping.
Picture avaliable for the TRC-458 ! ! !

2. A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

no mics

Please reply to email as I do not often get to this newsgroup. He wants to get this stuff sold ASAP, so please reply ASAP. I will reply to you from Monday to Friday only.

Thank-you,

A little old lady wanted to join a biker club. She knocked on the door of a local biker club and a big, hairy, bearded biker with tattoos all over his arms answers the door. She proclaims "I want to join your biker club." The guy was amused and told her that she needed to meet certain biker requirements before she was allowed to join.
So the biker asks her "You have a bike?"
The little old lady says "Yea, that's my Harley over there" and points to a Harley parked in the driveway.
The biker asks her "Do you smoke?"
The little old lady says "Yea, I smoke. I smoke 4 packs of cigarettes a day and a couple of cigars while I'm shooting pool."
The biker is impressed and asks "Well, have you ever been picked up by the Fuzz?".
The little old lady says "No, I've never been picked up by the fuzz, but I've been swung around by my nipples."

A woman went into a department store and told the clerk that she wanted to return a toaster for refund because it didn't work. The clerk told her that he couldn't give her a refund because she bought it on special. All of a sudden the woman threw her arms up and yelled, "Grab my Breasts! Grab my breasts!" The clerk didn't know what to do, so he called the store manager who asked her if he can help. She explained that she wanted to return the nonworking toaster for refund, and he told her that he would not give her a refund because she bought the toaster on special. Once again she yelled, "Grab my breasts! Grab my breasts!" The manager was taken aback and asked her why she was yelling that particular phrase. She replied, "Because I like my breasts grabbed when I'm getting screwed!"

I don't think he will move on a permanent basis either he is being flown back and forth to georgia. He left his kid when he went to work for dave so don't see him leaving for a few weeks at a time being a big deal.

they are some really nice pics. I wonder if the guys at x force can make
any of the segments lite up ... don't think they will be able to duplicate
this one, ...

Listen up NoCash Money, You sure got a thing for Mr.Gunn maybe you want to tell him to his face. and see if you don't end up on the short end of the stick....

Stick to peddling your bullshit boxes. dave has forgotten more about electronics than you and your rap star buddie skullcraka put togther. I am sure you know all about the "crack " thing since you probably live in the projects and ghettos.

CASH MONEY wrote in message

I would get a good 5/8 Wave ground plane antenna and put it 150 feet
in the air.

Greetings!

Nope, thats not even what I was talking about...

Please re-read those posts.

SSB mode was not entirely discussed.

The only section I was focusing on more - was the AM Regulator.

I'm sure that many people got their signals crossed on this. I wasn't giving a dissertation on SSB, only the involvement of the AM regulator while in SSB mode.

There are three posts from me relating to the AM regulator, I don't know how the SSB carp got into this - except for what Bob interpeted.

Which is not to say the interpetation was wrong, just skewed...

For some radios, the AM regulator produces Modulation for the AM side. When in SSB the PLL offsets the IF input to the Balanced modulator, buth the radio board I'm talking about, the PB-122 - the Balanced modulator is used all the time. It produces a carrier thru the audio IF x-tal filter, that when offset by the PLL control, one or the other envelope for audio is passed thru.

This is whats occuring in a PB-122 based board. You see both center [carrier] and audio sidebands being produced. But little audio passes thru from the Balanced Modulator while in AM mode - looking at the Audio IF section output. It's simply "center slot-ed" for IF and the crystal filter is removing both audio sidebands as it passes thru the x-tal filter - leaving carrier and some low end envelope.

It's the way it's designed to keep it simple and why the AM regulator has a tap on it that goes to the mic-amp section. To Uniden and Cobra, this is the down and dirty way of doing things, and why an NPN 2SC945 drives a PNP 2SB525 and the 2SA1012.

The PNP's are "paired" for form a Darlington Pair amplifier - to handle the AM power, and AM mod produced thru the 2SA1012. It's doing all the work on AM - with the balanced modulator simply providing the carrier [which does contain audio before filtering] IF to be mixed in the TX front end section with the PLL's offset IF.

It keeps down the amount of switching the radio has to do, both the Balanced Modulator and AM regulator section still work together in all modes of the PB-122 style boards. Thats whats so neat about it.

It really doesn't matter if audio is low-level modulated except when
in SSB mode, so filtering is kept the same, only shifted. The Mic amp
section feeds audio drive to the AM regulator and AM Mod amp along
with AM power section supplies the audio and DB bias to drive the
collectors while in AM.

In SSB the AM power is cut off [biased off] but the Mic amp section
can still affect operation and is used with ALC to "clean up" what
would otherwise be dirtied audio from excessive drive and filtering
done by the Balanced Modulator and Audio IF filter x-tal.

Thats what I'm talking about.

Uniden and Dynascan simplified the design to where the Balanced
Modulator can be used to provide the Audio for SSB, and just plain old
Carrier for AM - and the AM power section handles the Mic amp input to
drive the audio with a regulated carrier.

You guys didn't know this?

While Dancing with the Mouse on Sun, 12 Dec 1999 20:58:30 GMT, the
Modem interrupted with an MNI from "northwoods@mail.com (Dilon Earl)",
and the MotherBoard buffered this to Video RAM:
